**CHARACTERISATION OF A GLOBAL COLLECTION OF
DOTHISTROMA PINI ISOLATES.**

A thesis presented in partial fulfilment of the requirements
for the degree of Master of Science in Molecular Biology
at Massey University, Palmerston North, New Zealand.

**Rebecca Jayne Ganley
2000**

Errata (October 2000)

Page 1: Authorities for the subsequent species are as follows,

Pinus radiata D. Don

Mycosphaerella pini E. Rostrup apud Munk

Scirrhia pini Funk & Parker

Page 4:

'*Ophiostroma*' should be *Ophiostoma*

Section 2.1.1: Description of NEB10

NEB10 was received from Ned Klopfenstein, National Agroforestry Center, U.S.A. Records show that NEB10 was isolated in 1975 in Nebraska, USA from *P. nigra*. It is not known whether the NEB10 isolate received was the original strain (incorrectly assumed to be *D. pini*) or a cultured contaminant.

Page 28, Section 2.11.1: Description of 10C12

Monoclonal antibody 10C12 is a murine monoclonal subclass IgG1. It was produced by immunising inbred BalbC female mice with dothistromin conjugated, through the hydrogen atoms adjacent to aromatic hydroxyls on the anthraquinone skeleton, to Bovine serum albumin using the Mannich reaction. Mab 10C12 was tested against dothistromin analogues and it was shown that the bifuran ring of dothistromin was an important structure recognised by this antibody.

Page 50: Replace Table 4.2 with the following Table

Table 4.2 Effects of medium on dothistromin production by ALP3 (with shaking & light)

Culturing Conditions	Dothistromin		Mycelium
	($\mu\text{g ml}^{-1}$)	($\mu\text{g mg}^{-1}$ mycelium)	(mg ml^{-1})
'low' DB	1.00 \pm 0.20	1.19 \pm 0.11	0.88 \pm 0.23
AMM + 2% glucose	0.72 \pm 0.07	0.80 \pm 0.04	0.91 \pm 0.12

Results are mean \pm S.E.M. ($n = 3$)

Page 74:

The 10 d time point was chosen over 7 d as previous extractions of cultures incubated for 7 d had not tested positive for aflatoxin (see page 65).

Pages 55 & 74:

It was assumed that the 10 d isolates were in stationary phase of the growth cycle. However, growth curves (two replicates) completed by Monahan (1998) showed that the 10 days growth point marked the transition from exponential to stationary phase. More thorough studies would be required to verify this and to define the stages of development. In view of this, the 10 d growth point phase should be re-classified from stationary to late exponential.

ABSTRACT

Dothistroma pini is a filamentous fungus which infects *Pinus radiata*, New Zealand's predominant forest species. *Dothistroma* blight causes premature defoliation, a reduction in the rate of growth and, in extreme cases, death of the trees. This forest pathogen produces a toxin, dothistromin, which is implicated in the development of the disease symptoms. Only one strain of *D. pini* is thought to be present in New Zealand. However, world-wide there is a diverse range including the sexual form. A collection of *D. pini* strains from eight countries was collated in the UK. To prevent further introductions of 'foreign' *D. pini* to New Zealand and to assist in the identification and appropriate containment, should a new outbreak of needle blight occur, the *D. pini* isolates in this collection were characterised at both the species and individual strain level.

Sequence analysis of the ribosomal internal transcribed spacer (ITS) and the production of dothistromin by the isolates in the collection confirmed all were *D. pini*. Quantification of the levels of dothistromin produced by the isolates, in culture, showed a large variation between the strains. Isolates MIN11, NEB8, GUA1 and, in particular, ALP3 produced significantly more dothistromin than NZE1. Changes in culture environment and media types were shown to affect the levels of dothistromin produced by the *D. pini* isolates. However, these changes were not sufficient to support the production of aflatoxin.

To analyse the genetic diversity among the overseas *D. pini* isolates, a robust microsatellite-based DNA fingerprinting system was developed. Microsatellite loci were isolated. Primers designed to flank the microsatellite repeats were used for PCR amplification in the 'core' twelve *D. pini* strains. The unique fingerprint patterns obtained from these loci were used to distinguish the isolates to the individual strain level. This system of identification provides an effective tool for screening and prognosis of infected pine forest sites.

ACKNOWLEDGMENTS

First and foremost, I would like to thank my supervisor Rosie Bradshaw for all the tremendous time, effort and patience she has put into helping me with this project. Thank you for all the opportunities you have given me, the many people you have enabled me to meet and places to visit. This has really been a dream project!

To Bill, Dawn, Chris and Gordon at Hort Research thank you for your endless help with the ELISA work and for all the chats both scientific and social (especially the ones on soccer!), you guys definitely made doing these ELISAs a lot more enjoyable!

Paul Dyer and the rest of the lab at Nottingham University, my time there was short but it was great getting to know you all. Thanks for the bench space, the fumehood and everything else! And Nini...ah, Nini....what would I have done without you!?!

I would also like to thank The British Council and the Massey University Agriculture Foundation for funding towards this project and the Massey University Masterate Scholarship for helping to fund me.

To everyone in the RB lab, both past and present members, Brendon, Seth, Janet, Paula, Jonathan, Christine, honorary members; Bec and Rohan, and especially Bek its been a great couple of years. I've enjoyed all the good times, the poor times, the stimulating conversations, the diligence to duties and rosters within the lab and, most importantly, the continuous searches for my pens, scissors, nailfile, calculator (Blake's car), stapler...just to name a few!

And...outside of the lab; Lisa, Carolyn, Emily, Richard, Annika, Sheralee and everyone else who has helped out along the way, many thanks for the laughs, borrowings, chats and help over the last couple of years. Bec...I don't think I will ever really get over my

fascination with fruit flies. Ta for the natters, the lunches (you too, Anton) and letting me lend a hand.

Carla, Jenny and Emma, well, its been 5 years all up...5 wonderful years of Wellington weekends, holiday excursions and all the rest. Thank you guys so much for everything; for keeping me relatively sane, not talking “shop” and supporting me the whole way through. Justin, what can I say, thank you for understanding (literally) of what I was going through and for your support and patience at a very busy and critical time.

Finally, to my family Mum, Dad, Austen, Jules, Karen, Denise, Stevie, Georgia, Aunty Peg and Uncle John thank you for all your support and encouragement over the years. Mum and Dad, your endless love and support has been a major factor in the completion of this thesis. You always new I could do it, thank you for believing in me!
