Speech Driven User Interface For An Intelligent House

**A thesis presented in partial fulfilment of the
requirements for the degree of**

**Master of Engineering
in
Information Engineering**

**at Massey University, [Albany],
New Zealand.**

Zhenqing Liu

2005 March

Abstract

Speech driven user interface for an intelligent house is one of a number of Graduate research projects at Massey University. It is part of Project ‘Smart House’. This thesis details development of a control system whose inputs are speech signal rather than manual.

The control system consists of several sub-systems including speech recognition, command generation, signal transmission, signal reception and command manipulation. The completed speech driven user interface should operate in conjunction with Real-time implementation of a Microphone Array beam-former and Personal identity recognition that were developed concurrently with this project.

The speech recognition and command generation subsystems are implemented on a PC whereas the signal transmission, signal reception and command manipulation subsystems are designed at embedded board level. The remote controller can control some electrical appliances, such as TV and CD player, and switch and dim the light.

Acknowledgements

I wish to express my gratitude to the following people for their help during the course of this project. Special thanks go to my supervisor, Dr. Tom. Moir, who offered me this project, and who provided invaluable advice and motivated me to succeed. Thanks also to Joy. Wang, Tom Qi for their technical help in the process of building PCB board . Thanks to my parents for encouraging sponsoring me to get the M.S. degree. Thanks to my brother Dr. Zhenguo Liu for his technical help in process of designing the antenna. Thanks to Samir for his administrative help. This would not have been possible without the support of my friends and family.
