Emissions Trading, Carbon Pricing, and the Impact on Carbon
Producing Firms: A Study of Phase III of the European Union
Emissions Trading Scheme

A thesis presented in partial fulfilment of the requirements of the degree of
Master of Business (Finance)

At Massey University, Palmerston North,
New Zealand

Grace Emily Maddox

June 2018

ABSTRACT

This thesis examines the firm level impact of the European Union Emissions Trading Scheme (EU ETS), the ability to hedge carbon price, and the determinants of carbon price. The analysis focuses on phase III of the EU ETS. The work of Koch and Bassen (2013) is extended by investigating whether carbon-adjusted expected returns differ post-2013, as the trading scheme shifted to full auctioning. The findings show a lack of significant exposure to carbon price for the majority of carbon producing European firms. For firms where significant exposure to the price of carbon was found, firms' returns required on equity were substantially higher after carbon exposure was considered. Whether carbon could be hedged effectively using conventional techniques was investigated, and a simple ordinary least squares hedge ratio was found to be the most effective. Further, the hedge ratio for carbon was found to be within the normal 0.5-1 range of typically hedged commodities. Finally, the carbon price determinants were investigated to determine whether energy prices and weather explain the carbon price in phase III, and how this relationship changed since full auctioning came into place in 2013. Energy prices were found to impact carbon price in phase III, however, the best model explained only 12% of carbon price variation. Weather variables were not found to impact carbon price except in one case of unanticipated temperature change. The results indicate that it is not the temperatures themselves that impact carbon price, rather unanticipated changes in temperature.

ACKNOWLEDGEMENTS

This thesis could not have been completed without the support of many.

Firstly, I owe a great deal of gratitude to my supervisor Dr Martin Young. I'm grateful for the freedom to pursue an area of my own interest, and the help given to turn my ideas into a real topic. I so appreciate the unwavering support, encouragement, and patience in the tough moments.

I would like to thank Hamish Anderson, without whom I would not have ended up studying finance. The continuous support and guidance I have received throughout my studies is not taken lightly.

I would also like to thank Fong Mee Chin for the support she gives each post-graduate student. I am grateful for the assistance in data collection and time she made available to me.

Finally, I would like to express my unending gratitude to my fiancé for his patience, encouragement and emotional support. I could not have completed this thesis without you at my side. To the rest of my family, and mum and dad, this is for you.
