# **IMPROVING PRODUCTIVITY IN ROAD PAVEMENT MAINTENANCE AND REHABILITATION IN NEW ZEALAND**

A Thesis presented in fulfillment of the requirements for the degree of Master of  
Construction Management

School of Engineering and Advanced Technology, College of Sciences  
Massey University, Albany  
New Zealand

Saeed HAJI KARIMIAN

2014

## **ABSTRACT**

Improving the productivity of the multi-billion dollar annual investment in the maintenance and rehabilitation of the roading infrastructure could bring about huge cost savings and ensure optimal use of resources and tax payers' money. There is currently little or no research on productivity improvement of the New Zealand roading sector. This study aimed to identify productivity constraints and improvement measures in the road maintenance and rehabilitation (RMR) sector in New Zealand. The study also aimed to provide insights into the RMR process and the criteria that inform strategic decisions for action. Based on a descriptive survey method, qualitative and quantitative data were gathered through pilot interviews and on-line surveys. The investigations were limited to the views of consultants and contractors involved in the New Zealand road pavement maintenance and rehabilitation sector. Content analysis and multi-attribute methods were used in the analysis of the primary data for this research.

Results from the pilot interviews revealed 61 productivity constraint factors. These were aggregated into two main categories: internal and external factors, with an additional eight sub-categories. The five internal factor sub-groups were project finance, workforce, technology/process, project characteristics, and project management/project team characteristics. The three external factor sub-groups were statutory compliance, unforeseen circumstances, and "other" external forces.

Results of the multi-attribute analysis showed that inaccurate estimates, lack of good leadership management capacity, resistance to accept new technologies in road maintenance projects, site location and environmental constraints, and frequency of design changes/change orders/late changes were the most influential internal constraint factors on the level of productivity in the road maintenance and rehabilitation sector in New Zealand. Additionally, the Health and Safety in Employment Act, Resource Management Act, inclement weather, market conditions and the level of competition in the industry for jobs were the most significant factors under the broad category of external constraints.

Recommendations for improving productivity in the New Zealand RMR sector include providing more training courses for the workforce to participate in, in order to improve the level of skills and experience in the work force; having sufficient budget for using new technologies, such as road failure detection systems; using new cost-effective materials with a longer life cycle; providing accurate estimations; applying up-to-date leadership management skills; and improving the quality and accuracy of designs to minimise design errors and late change orders; as well as having adequate planning and regular monitoring of the entire process. It is expected that the application of these recommendations by designers, project managers and contractors could lift efficiency and productivity in the RMR sector and ensure optimal use of resources in the sector, as well as boost the New Zealand economy.

**Keywords:** New Zealand roading industry, productivity, road construction, road pavement maintenance, road pavement rehabilitation.

## **ACKNOWLEDGEMENTS**

I would like to express the deepest appreciation to my supervisor, Dr Jasper Mbachu, for his great advice and guidance in the process of this research.

I would like to gratefully and sincerely thank Mr Kacha Vuletich for his support, understanding, patience, and most importantly, his friendship while undertaking this research at Fulton Hogan.

I would also like to acknowledge the project managers, contractors and subcontractors who volunteered their time to participate in the surveys, for their invaluable contributions to the research.

Finally, and most importantly, I would like to thank my family members for their enormous support, encouragement and their faith in me, and for allowing me to be as ambitious as I wanted.

## **STATEMENT OF ORIGINALITY**

### **STATEMENTS OF ORIGINALY**

#### **(MASTER OF CONSTRUCTION MANAGEMENT) THESIS**

**TITLE:** IMPROVING PRODUCTIVITY IN ROAD PAVEMENT MAINTENANCE  
AND REHABILITATION IN NEW ZEALAND

I declare that the above thesis is my own original work. It has not been submitted elsewhere for assessment.

The guidance received from my supervisor is hereby acknowledged. Human Ethics requirement have been complied in accordance with Massey University research requirements.
