Abstract

The purpose of this research was to assess the relationships between emotional intelligence (EI), self-efficacy, cognitive stress appraisals, coping strategies and affect responses based on Lazarus and Folkman's (1984), transactional model of stress.

The study consisted of 89 employees from three organisations of the private sector in New Zealand. The participants completed a web-based survey which included self-report questionnaires of Cognitive Appraisal Scale (CAS), the Brief COPE, the workplace Swinburne University Emotional Intelligence Test (workplace SUEIT), the General Self-efficacy Scale and the Job Related Affective Wellbeing Scale (JAWS).

The research findings indicated that there were associations between threat appraisal, maladaptive coping (i.e., avoidance) and negative affect. Associations were not found in the positive pathway of the model (i.e., challenge appraisal, adaptive coping, e.g., task focused and emotion approach coping, and positive affect). Associations were also found between emotional intelligence, task focused coping and positive affect. Similarly self-efficacy was found to be an effective resource factor in task focused coping and positive affect. Self-efficacy significantly related positively with challenge appraisal and negatively with threat appraisal. Both EI and self-efficacy associated negatively with emotion approach coping which included seeking instrumental and emotional support. There was a strong association found between EI and self-efficacy which supported previous empirical findings that cognition and emotion play an inter-connected role in the stress process. Surprisingly, EI and self-efficacy did not mediate between challenge appraisal - adaptive coping and adaptive coping - positive affect responses respectively.

Future implications of the study are that both emotional intelligence and self-efficacy should be considered as efficient positive personal resources in organisations. Since both these strengths can be learnt and developed, it was recommended that close consideration should be given to enhance these skills among employees of varied job roles.
Effective use of emotional intelligence and self-efficacy are likely to create happy, optimistic, engaged workers who will be equipped with healthy leadership styles, manage relationships better, will be cooperative and work well in teams.

This study extends prior research that has identified relationships between cognitive appraisal, coping and affect in a transaction model of stress. It also explored the relationship of emotional intelligence and self-efficacy within this stress model. It addresses the effective use of two human strengths which will enhance adaptive coping strategies to experience positive psychological states in demanding situations. Consistent with the recent escalating investigations and approaches in the field of positive psychology, this study gives rise to focus on developing positive strengths in employees in the workplace – which may prove more rewarding than attempting to repair or minimize their weaknesses.
I would like to express my sincere thanks to Dr Dianne Gardner, my supervisor for sharing her invaluable knowledge and technical expertise with me. Your continuous support, zest, concern and time spent are deeply appreciated.

Heartfelt thanks to my friend Iyanthi. If not for your unconditional support, motivation and consistent confidence in me, I would not have been able to complete this study, particularly during a difficult period in the previous year. My warm appreciation goes to my father and sister, with tender gratitude to my mother for her constant encouraging words and unconditional love.

Thank you to all the employees, the organisations and especially to the representative coordinators for their enthusiasm and assistance extended towards this project. Your participation made it possible for me to move forward.

CHAPTER ONE

INTRODUCTION 1

1.1 Scope and Importance of Occupational Stress 1
1.2 Organisational Stress, Health & Wellbeing 2
1.3 Financial Implications of Occupational Stress 3
1.4 Legal Implications of Occupational Stress 4
1.5 A Paradigm Shift to Occupational Stress Reduction 5

CHAPTER TWO

TRANSACTIONAL MODEL OF OCCUPATIONAL STRESS & COPING 7

2.1 Models of Occupational Stress and Demands 7
2.2 A Transactional Approach to Stress 8
2.3 Cognitive Stress Appraisals 12
2.4 Coping Strategies 14
2.5 Affective States 19
4.7. Self-efficacy and Affect 56
4.8. Self-efficacy and Mediating Associations 58

CHAPTER FIVE

METHOD 61
5.1 Overview 61
5.2 Participants 61
5.3 The Survey 61
5.4 Measures 64
5.4.1 Primary Appraisal 64
5.4.2 Coping 64
5.4.3 Emotional Intelligence (EI) 65
5.4.4 General Self-efficacy 66
5.4.5 Positive and Negative Affect 66
5.5 Data Analysis 67

CHAPTER SIX

RESULTS 69
6.1 Correlation Matrix 69
6.2 Hypotheses Testing 69
6.2.1 Direct Correlations of Appraisal, Coping and Affect 69
6.2.2 Direct Correlations of EI with appraisal, coping, self-efficacy and affect 71
6.2.3 Direct Correlations of Self-efficacy with appraisal, coping and affect 72
6.3 Mediating Hypotheses and Analysis 74
CHAPTER SEVEN

DISCUSSION

7.1 Cognitive appraisal, coping and affect pathways

7.2 EI with appraisal-coping-affect

7.3 Self-efficacy with appraisal-coping-affect

7.4 EI with Self-efficacy

7.5 EI as a mediator

7.6 Self-efficacy as a mediator

7.7 Limitations of the study

7.8 Implications for research

7.9 Implications for practice

7.10 Conclusion
