ENVIROMENTAL IMPLICATIONS OF PHYTOEXTRACTION FOR MERCURY AND GOLD

A thesis presented in partial fulfilment of the requirements for the degree of Master of Science in Earth Science at

Massey University

Fletcher Abduel Msami Msuya

2000

Massey University
Palmerston North
New Zealand
ACKNOWLEDGEMENT

My sincere thanks are due to my chief supervisor Professor Robert Brooks for his encouragement, guidance and advice during this study. I personally thank him and his family for being very supportive and concerned about my peaceful stay in New Zealand.

I feel greatly indebted to Dr. Chris Anderson and Dr. Brett Robinson for their tireless assistance, guidance and cooperation during the whole period of this study.

I thank all members of staff of Soil and Earth Sciences, in particular Assoc.Prof. Mike Hedley, Dr. Robert Stewart, Assoc. Prof. Paul Gregg, Assoc. Prof. Nanthi Bolan, Dr. P. Loganathan and Assoc. Prof. Vince Neall for their support; the Secretary Hera Kennedy for her patience and support, the technical staff namely, Mike Bretherton, Ian Furkert, Bob Toes, Anne West, Glenys Wallace and Ross Wallace, who were always ready and willing to offer assistance and memorable amusement.

I would like to extend my appreciation to my colleagues namely, James Hanly, Asoka Senerath, Steven Trolive, Bhupinderpal Singh, Afriqur Khan, Tin Maung Aye, Jamie Blennerhassett, Hewana Sumanasena, Saman Bowatte, Arivin Rivaie, Liu Qinhe, Hutham Sabti and Liao Mingtan, for their assistance especially with computer work.

I wish to acknowledge the support of the New Zealand Overseas Development Agency for a grant to enable me to study at Massey University. I also feel greatly indebted to my Company Pugu Kaolin Mines Ltd., The State Mining Corporation and the government of Tanzania, for allowing me to pursue further studies in New Zealand.

I would like to thank my friends and their families both in Australia, New Zealand, and Tanzania namely Glenda Mill, Alphonce Ndibalema, Fred Mpelasoka, Aliu Sartie, Prof. Cliff Studman and his wife Irene, Tara Nath Pandey and his wife Narayani Tiwari Pandey, Gary George, Peter and Christine Akester, my uncle Abduel Kenge, Peter Gembe, Hayaz Mruma, Dickson Mchomvu and Dr. G.A. Mchomvu. I wish to thank sincerely my brothers Haldgod, Zacharia, Elihuruma and Kajiru, my sisters Emma, Veronica, Beatrice, Mary and Happiness and their families, for their support during my study.

Most importantly, I would like to express my deepest thanks to my family namely, my wife Grace and children Emma, Naetwe, Masecha and Joseph for their inspiration, understanding, faith and support during the course of my study.

I dedicate this research to my late parents:
Abduel Msami Msuya and Tamari Abduel Msami Msuya.
Environmental Implications of Phytoextraction for Mercury and Gold

ABSTRACT

The overall objective of this study was to investigate how plants could be used to harvest gold (phytomining) and at the same time remove mercury (phytoremediation) from auriferous mercury-contaminated soils. This study was undertaken to find appropriate plants that could be used to harvest gold, residual in mine tailings or in uneconomic low-grade ore, and at the same time remove residual mercury, commonly used to extract the gold in artisanal mining areas. Different procedures involving analytical methodology, leaching of acid mine tailings and the growing of plants in both gold and mercury-bearing substrates were undertaken.

The analytical methods involved in the analysis of gold in the laboratory using the modern instruments were Flame Atomic Absorption Spectrometry (FAAS) and Graphite Furnace Atomic Absorption Spectrometry (GFAAS). The determination of mercury involved using Flameless Atomic Absorption Spectrometry.

To understand the induced solubility of metals in phytoextraction, Tui mine tailings were leached with several chemicals known to solubilise gold: ammonium thiocyanate, ammonium thiosulphate and urea. The pH of the tailings material was varied through amendment with lime to examine the effect of this geochemical parameter on metal solubility and thus the potential for both plant uptake and leaching. The Tui mine tailings were chosen because of their geochemistry; these are highly weathered sulphide-ore tailings that leach heavy metals into adjacent water systems.

The induced-phytoextraction potential of root crops was also examined in this thesis. Five root crops were grown in an artificial substrate consisting of 3.8 mg/kg (ppm) of elemental gold dispersed in sand. The possibility of using these root crops for phytomining was determined by separately adding chelating agents ammonium thiocyanate and ammonium thiosulphate to the substrate. In most cases there was a higher gold concentration in the roots than in the shoots. The highest mean gold
concentrations were found in carrot roots and in roots of two radish cultivars. It was concluded that there was some potential for the use of carrot to grow an economic crop of gold from mine tailings.

Results obtained from experiments where plants were grown in Tui tailings indicated that both chicory and *Brassica juncea* could be used for the phytoextraction of gold and mercury in the same crop. Under acidic conditions thiocyanate induced the uptake of gold by *Brassica juncea* and the uptake of mercury by chicory; and thiosulphate induced the uptake of mercury by chicory, but it did not induce the uptake of gold by the same plant. Under alkaline conditions, treatment with ammonium thiosulphate induced the uptake of gold and mercury by *Brassica juncea*; and treatment with thiosulphate induced the uptake of mercury by chicory but it did not induce the uptake of gold. It was therefore concluded that, *Brassica juncea* could be used for phytoextraction of gold and mercury when ammonium thiosulphate is applied to the substrate. Results from the root-crop experiment indicate that, carrots could supersede most of the plants used due to the greater apparent metal-uptake potential.

Finally, a model is proposed for field trials to examine the potential of phytoextraction for gold and mercury in Tanzania. The aim of this model is to examine how the positive results obtained from research conducted in the laboratory and greenhouse can be put into practice. The use of similar plants as well as traditional tropical species (e.g. wild cassava – a known accumulator of cyanide) is suggested along with suitable chemical amendments.

CHAPTER 2 - ANALYTICAL METHODOLOGY FOR GOLD AND MERCURY DETERMINATIONS USING FLAME ATOMIC ABSORPTION SPECTROMETRY (FAAS), GRAPHITE FURNACE ATOMIC ABSORPTION SPECTROMETRY (GFAAS) AND FLAMELESS ATOMIC ABSORPTION SPECTROMETRY

2.1 Introduction
2.1.1 Use of organic solvents

2.2 Analytical techniques for gold and mercury determinations
2.2.1 Flame atomic absorption spectrometry (FAAS)
2.2.2 Graphite furnace atomic absorption spectrometry (GFAAS)
2.2.3 Flameless atomic absorption spectrometry

2.3 Sample preparation
2.3.1 Analysis of substrate
2.3.2 Determination of gold in plants
2.3.3 Determination of mercury in plants

CHAPTER 3 - METAL LEACHING OF TUI MINE TAILINGS AND ITS SIGNIFICANCE FOR THE ENVIRONMENT AND PHYTOMINING FOR GOLD

3.1 Introduction

3.2 Aim of the experiment

3.3 Materials and methods
3.3.1 Design for leaching experiments
3.3.2 Chemical analysis of leachates

3.4 Results and discussion
3.4.1 Extraction from unlimed tailings: low pH
3.4.2 Extraction from limed tailings (at 0.3% lime)
3.4.3 Enhancement of extraction by use of increasing concentrations of thiocyanate and thiosulphate
3.4.4 Extraction behaviour of thiocyanate and thiosulphate over a range of pH

3.5 Conclusions

CHAPTER 4 - CHEMICALLY INDUCED GOLD UPTAKE BY ROOT CROPS FOR THE PURPOSE OF PHYTOMINING

4.1 Introduction

4.2 Aim of the experiment

4.3 Materials and methods
4.3.1 Plants
4.3.2 Auriferous Substrate
4.3.3 Plant Growth Experiments

4.4 Chemical Analysis

4.5 Results and Discussion

4.6 Conclusion

CHAPTER 5 - INDUCED UPTAKE OF GOLD AND MERCURY BY PLANTS FOR THE PURPOSE OF PHYTOEXTRACTION

5.1 Introduction
   5.1.1 Artisanal miners and the use of mercury
   5.1.7 Mercury and gold
   5.1.8 Gold, mercury and plants

5.2 Aim of the experiment

5.3 Materials and Methods
   5.3.1 Plants used
   5.3.2 Tui mine tailings substrate
   5.3.3 Design for plant growth experiments

5.4 Chemical analysis
   5.4.1 Analysis of gold in plant samples
   5.4.2 Determination of mercury in plant samples

5.5 Results and Discussion
   5.5.1 Gold and mercury uptake by different plants by use of a substrate amended with lime
   5.5.2 Gold and mercury uptake by plants using substrate not amended with lime
   5.5.3 Correlation of gold and mercury

5.6 The potential for phytoextraction of mercury and gold together in a single crop
   5.6.1 Economic factors
   5.6.2 Practical application of phytoextraction to artisanal gold mining in Tanzania
   5.6.3 Proposed model for field trials for gold and mercury phytoextraction in Tanzania

5.7 Conclusions

CHAPTER 6 - GENERAL CONCLUSION

6.1 General

6.2 Future outlook
