**DETERMINATION OF THE DISTRIBUTION
OF WATER DROPLET SIZES IN BUTTER AND
MARGARINE USING PULSED FIELD
GRADIENT-NMR AND CONFOCAL
SCANNING LASER MICROSCOPY**

This thesis was presented in partial fulfillment of the requirements for
degree of Master of Science in Chemistry at Massey University

Abstract

PFG-NMR has been used to determine the distribution of water droplets in emulsions. Especially, it has been used to measure the samples with high optical dense systems and highly viscous systems (Butters and Margarines).

To refine the method, the optimum measuring condition was investigated. It included delay time (Δ) between the field gradient pulses, τ null (τ_0), gradient strength (G), water self-diffusion coefficients (D) and sampling techniques. Under the optimum conditions the water droplet size distributions of commercial butters, experimental butters and margarines were measured.

Experimental results showed that PFG-NMR is an accurate, fast method to determine the water droplet size distributions of the butters and margarines. Also, it can be used to investigate the properties of dispersed phase in emulsions. Especially, the method is suitable not only in the laboratory but also in the factory environment. The method was able to distinguish different distributions in butters of the same water content but with different manufacturing techniques. Differences in the distributions of water droplets were also obtained when comparing butters made by the same manufacturing technique but with different water contents.

To confirm the results from PFG-NMR, confocal scanning laser microscopy (CSLM) was chosen to determine the droplet size distributions and the moisture contents of samples. Comparison between PFG-NMR and CSLM shows limitations in the latter techniques and its uses are limited.

Acknowledgments

I would like to thank the following people who gave me great assistance when undertaking my studies at New Zealand Dairy Research Institute (NZDRI) and Massey University.

The biggest thanks go to my co-supervisors for their supervision and enthusiasm during the research of this project: Associate Professor Ken Jolley (Massey University) and Principle Research Scientist Alastair H MacGibbon (NZDRI).

Special thanks go to the Professor Andrew Brodie (Massey University).

If there are not their kind encouragement and assistance, I would not have finished my study in Massey University.

I wish to further thank the following people. Much of the work would not have been possible without the gratefully acknowledged contributions from the these people:

Yvonne van der Does (NZDRI) for her kind assistance in the project.

Tony McKenna (NZDRI) for help in the study of Confocal Scanning Laser Microscopy (CSLM).

Robyn L Hisrt (NZDRI) for help in the sample preparations of CSLM.

Dr. Pat W M Janssen (NZDRI) for introducing me to use the VIPS program of image analysis and refine the program.

Susan Lane (NZDRI) for separation of the aqueous phase and the milkfat phase from butters.

Dr. Sarah L Codd (Massey University) for high resolution NMR measurements (Bruker AMX 300).

Dr. Pat J B Edwards (Massey University) for high resolution NMR measurements (JOEL-GX 270).

My Chinese friends: Dr. Yinqu Wu, Dr. Fuguang Cao and Yuming Li.

Thanks also to members of the Food Science Section of NZDRI and the Institute of Fundamental Sciences for their assistance and help.

Thanks to other who have helped me directly and indirectly, thank you.

My thanks to the Studentship Fund from NZDRI.

I would finally like to thank the members of my family:

I great thank my older sister for her encouragement and assistance honestly, thank my parents for their support and thank Pinlei Lu – my son.

TABLE OF CONTENTS

Dedication	i
Abstract	i
Acknowledgments	ii
Table of Contents	v
List of Figures	ix
List of Tables	xiii
1.0 Introduction	1
2.0 Background theories and techniques	11
2.1 Pulse field gradient NMR method (PFG-NMR)	11
2.1.1 Basic theory of pulse field gradient NMR method	11
2.1.2 Droplet size application for NMR-minispec	19
2.1.3 Droplet size distribution	19
2.2 Confocal scanning laser microscopy (CSLM)	22
2.2.1 Basic theory of confocal scanning laser microscopy	22
2.2.2 Z-series experiment	26
3.0 Experimental methods and materials	28
3.1 Instrumentation	28
3.1.1 NMR spectrometers	28
3.1.2 Confocal scanning laser microscopy	28

3.2 Samples	29
3.3 Sample preparation	29
3.3.1 NMR samples	29
3.3.2 Confocal scanning laser microscopy (CSLM)	31
3.3.2.1 Dye preparation	31
3.3.2.2 Preparation of CSLM sample	31
3.4 Data analysis	31
4.0 Results and discussions	32
4.1 NMR measurements	32
4.1.1 Pulse sequence used in diffusion measurements	32
4.1.2 Choice of optimum measuring conditions	32
4.1.2.1 The delay time Δ between the field gradient pulses	32
4.1.2.2 τ null (τ_0)	33
4.1.2.3 Gradient strength (G)	35
4.1.3 Choice of water diffusion coefficient	39
4.1.3.1 Determinations of water self-diffusion coefficients	39
4.1.3.2 effect of choice of D on the water droplet size distribution	41
4.1.4 Sampling techniques	42
4.1.5 Distribution of water droplet size in commercial and experimental butters	45
4.1.5.1 Distribution curves of water droplet sizes by volume	46
4.1.5.2 The distributions of water droplet sizes in experimental butters with different moisture contents	48
4.1.5.3 Distributions of water droplet sizes in butters made using different manufacturing techniques	50

4.2 Confocal microscopy	52
4.2.1 The Sampling	52
4.2.1.1 Use of microscope slide in dyeing sample	52
4.2.1.2 Small cube of sample stained in a beaker	53
4.2.1.3 Uses of copper dish	56
4.2.2 Dyeing techniques	58
4.2.2.1 Comparisons between Nile Blue in glycerol and Nile Red in corn oil	58
4.2.2.2 Nile Blue	59
4.2.2.3 Comparisons between Nile Blue in Milli-Q water and Nile red in propylene glycol	61
4.2.2.4 Butter samples	63
4.2.3 Choosing the magnifications of images	66
4.2.4 Z-series experiments	71
4.2.5 Analytical program of the droplet sizes and droplet numbers in emulsions by computer	71
4.2.6 The distributions of water droplet numbers	75
4.2.7 The distributions of droplet volume	76
4.2.8 The measurements of moisture contents	78
4.3 Comparison between the results of the PFG-NMR method and the results of the confocal scanning laser microscopy	81
4.3.1 Water droplet size by volume distributions	81
4.3.2 Irregular droplets	83
4.4 Comparison between the results of low resolution NMR and high resolution NMR	86

5.0 Conclusions and future works	87
6.0 References	90
7.0 Appendix	98
Appendix 1. The Hahn spin-echo experiment and the Hahn spin-echo experiment with pulse field gradient	98
Appendix 2. Self-diffusion coefficients	105
Appendix 3. The images of samples from CSLM	110
Appendix 4. Conversion of the droplet diameter	120
