Optimisation of the Thermal Processing of Mussels

A thesis presented in partial fulfilment of the requirements for the degree of Master of Technology in Bioprocess Engineering at Massey University

ABSTRACT

_Perna canaliculus_, more commonly known as the green-lipped mussel, is unique to New Zealand and is the foundation of the mussel farming industry in this country. This project aimed to identify practical ways to improve the thermal processing of mussels to maximise yield.

Initial work was carried out to characterise the composition of the mussel tissue. Following this, a method to quantify the cooking losses was developed. This methodology was used to examine the rate and extent of cooking losses in mussel tissue at various temperatures. Further to this it was possible, using differential scanning calorimetry, to examine the kinetics of protein denaturation associated with cooking losses.

The cook loss trials over various temperatures showed a definite increase in water loss once a temperature of approximately 65°C was reached. A relationship was developed between the water loss exhibited over a range of temperatures and the rate of protein denaturation. It was found that low temperature, long time cooking results in increased yields. These conditions will reduce the impact of temperature gradients through the mussel. The exact time temperature regime used commercially will be a compromise between moisture losses, microbial destruction, inactivation of rancidity causing enzymes and production restraints.

This regime was tested for whole and half shell mussels resulting in up to 4.5% increases in yield.

2.4.2 Mechanism of water loss

2.4.2.1 Factors affecting protein denaturation

2.5 Characterisation of water in muscle

2.5.1 Importance of WHC

2.5.2 Methods of determining WHC

2.6 Conclusions

CHAPTER 3 - MUSSEL CHARACTERISATION

3.1 Mussel variability

3.2 Mussel condition

3.2.1 Methods and materials

3.2.1.1 Sample

3.2.2 Variation over the sampling period

3.3 Natural pH variation

3.4 Natural Salt variation

3.5 Mussel composition

3.6 Conclusion

CHAPTER 4 - CHARACTERISATION OF THE MOISTURE CONTENT OF MUSSEL MEAT

4.1 Preliminary variability

4.1.1 Nature of water associated with muscle

4.2 Characterisation of moisture in mussel tissue

4.2.1 Water holding capacity

4.2.1.1 Filter paper press method

4.2.1.2 Centrifuge method

4.2.1.3 Comparison of moisture in whole and homogenised mussels

4.3 Developed methodology

4.4 Conclusions

CHAPTER 5 - FRESH WATER MUSSEL COOKING

5.1 Introduction

5.2 Initial cooking trials

5.3 Experimental method development

5.3.1 Prediction of heating rates in mussels
5.3.1.1 Thermal properties
5.3.1.1.1 Specific heat capacity
5.3.1.2 Thermal conductivity
5.3.1.2 Model solution
5.3.2 Apparatus development and assessment
5.3.3 Conclusions
5.4 Dynamic cooking trials
5.5 Effect of temperature on rate of cooking losses
5.6 Effect of temperature on extent of cooking losses
5.7 Conclusions

CHAPTER 6 – KINETICS OF COOKING
6.1 Introduction
6.2 Differential scanning calorimetry
   6.2.1 Methods and materials
      6.2.1.1 Standard DSC trials
      6.2.1.2 Kinetic studies
6.3 Thermal transition in mussel fractions
6.4 Characterisation of the kinetics of protein denaturation
6.5 The effect of salt concentration on protein denaturation
6.6 The effect of cooking at various temperatures
6.7 Prediction of moisture loss from kinetic data
6.8 Conclusions

CHAPTER 7 – VALIDATION
7.1 Introduction
7.2 Methodology
7.3 Commercial implications

CHAPTER 8 – CONCLUSIONS AND RECOMMENDATIONS
