Acknowledgments

The following made substantial contributions to this research and I wish to thank them for their help, encouragement, and wisdom:

• Emeritus Professor George Shouksmith who was a gentle supervisor who coaxed me back from the many precipices that one stumbles upon when first doing a Master’s thesis.

• Dr Mary Mattis, Senior Research Fellow of Catalyst, New York who kindly provided me with Catalyst publications.

• My mentors who gave me first-hand knowledge of this area and other areas relevant to my research, my work, and my life.

• My protégé whomever she or he might be.

• Peter Moore who has always encouraged my learning and career development.

• My parents who taught me to value learning.

• Hadley Brown from the Institute of Chartered Accountants for his helpful feedback.

• Those at NZIM who went far beyond what one would reasonably expect, and without whose unstinting help I would have had an $N = 28$ rather than $N = 115$, particularly David Chapman FNZIM, CEO, NZIM National Office and the National team and Ian Balfour FNZIM, CEO, NZIM Central Division and his team, with a special thanks to Craig Marsh and Colleen Cording.

• A very grateful thanks to all the participants who took the time to fill out a very long and comprehensive questionnaire.

• And especially thank you to my treasured fiance Arnold Chamove whose selfless support, guidance, chocolates and endless cups of coffee has taught me the true meaning of ‘mentoring’.
Abstract

The literature concerning the influences on career and psychosocial functions of mentoring are inconsistent concerning formality (formal vs. informal initiation of the mentoring relationship), inconsistent concerning gender composition of the dyad, non-existent concerning the effect of the mentor and protégé being in the same or different organisations, but consistent concerning the effect of supervisory status, namely that mentors who supervise their protégés provide more career assistance than non-supervisory mentors. In order to see if the level of career and/or psychosocial assistance was different depending on formality of the mentoring relationship, gender composition of the mentoring relationship, and organisational distance between the mentor and protégé, a 198-item questionnaire was sent to 954 senior and executive New Zealand business people. Twenty seven percent returned questionnaires reporting on developmental relationships either as a mentor, a protégé, or other relationships. No female mentors with male protégés were analysed because of their paucity. In the analysis of data from 115 mentors it was found that career assistance was rated as more important than psychosocial assistance in determining impact on a protégé’s career. It was found that the overall level of career assistance was affected by (a) the gender composition of the mentoring relationship and (b) whether the mentor was in the same organisation as the protégé. The overall level of psychosocial assistance was affected by (a) the gender composition of the mentoring relationship. The level of career and psychosocial assistance was not affected by (a) whether the mentor was a protégé’s supervisor or not, or (b) whether the relationship was formal or informal in its initiation. Results suggest that (a) both male and female protégés should select (b) male mentors from (c) the same organisation for maximal (d) career and (e) psychosocial assistance. That nine covariates were used can account for the discrepancy in results with previous studies. A hypothesis for Protégé Influence is formulated and found to be superior to previous hypotheses of Mentor Power and Mentor Risk in accounting for differences in career- and psychosocial-assistance behaviour of mentors.
