METHODS OF REPRESENTING THE STRUCTURE OF

COMPLEX INDUSTRIAL PRODUCTS

ON COMPUTER FILES,

TO FACILITATE PLANNING, COSTING

AND RELATED MANAGEMENT TASKS.

A thesis presented
in fulfilment of the requirements
for the degree of
Master of Technology in
Manufacturing and Industrial Technology
at
Massey University

SARA BURNS
1992
ABSTRACT

When the original concepts for the computerisation of product structures were developed in the late 1960's the available computer power was very limited. A modularisation technique was developed to address the situation in which a number of similar products were being manufactured. This technique tried to rationalise these products into family groups.

Each member of the family differed from the others due to the possession of different features or options. However there was also a high degree of commonality to give the product membership of the family. Modularisation involved the identification of the options and features providing the variability. Those parts remaining tended to be common to all members of the family and became known as the common parts. Separate Bills of Material (BOMs) were set up for each of the identified options or features. Another BOM was set up for the common parts. The simple combination of the required options and/or features BOMs with the common parts BOM specified a product. Computer storage requirements and redundancy were reduced to a minimum. The Materials Requirements Planning (MRP) system could manipulate these option and feature BOMs to over plan product variability without over planning the parts common to all members. The modularisation philosophy had wide acceptance and is the foundation of MRP training.

Modularisation, developed for MRP, is generally parts orientated. An unfortunate side effect tends to be the loss of product structure information. Most commercial software would list 6 resistors, Part No. 123, in the common parts BOM without concern as to where the resistors are fitted. This loss of product structure information can hide the fact that two products using these 6 resistors 'in common' are in fact different as they do not use the resistors in the same 6 places. Additional information must be consulted to enable the correct assembly of the 'common' portion of these products.
The electronics industry is especially affected by this situation. This industry has changed considerably since the late 1960's. Product variability can be very high. Changes and enhancements are a constant factor in products having a relatively short life span. The modularisation technique does not have a good mechanism for the situation where an option itself has options or features. This situation can exist down a number of layers of the family tree structure of an electronics product. Maintenance of these BOMs is difficult.

Where there are options within options the designers and production staff need to know the inter-relationship of parts between options to ensure accuracy, compatibility and plan assembly functions. The advent of computerised spreadsheets has made the maintenance of this type of product structure information easier. This matrix is another separate document which must be maintained and cross checked. It will inevitably differ from the BOMs periodically.

This thesis develops a product structure Relational BOM based on the matrix for the family of products. The processing power of the 1990's computer is fully utilised to derive the common parts for any or all of the selected products of the family. All product structure information is retained and the inter-relationship of parts is highly visible. The physical maintenance of the BOMs is simple. The BOM serves all purposes without the need for supplementary information. It is fully integrated into the Sales Order Entry, MRP, Costing, Engineering Design and Computer Aided Manufacturing (CAM) systems.

This technique has been proven by being the only system used in one Electronics Design and Manufacturing organisation for over 1 year without any major problems.

As described in Section 1.6 user satisfaction has been high. The response of the users to the suggestion 'lets buy an "off the shelf" package' is very negative, as it would not incorporate this BOM system. Users have expressed the opinion that EXICOM could not continue, with present staffing levels, using the traditional BOM structure.
ACKNOWLEDGMENTS

I wish to thank the management and staff of EXICOM without whose co-operation this study would not have been possible. The faith they pinned on a totally untried concept demonstrates the desperate situation which had developed. The fact that management were unable to find consultants able to suggest a better course of action is indicative of the lack of understanding within this country, and possibly further afield, of this problem. Most consultants had not thought beyond the accepted methodology as developed in the late 1960s.

One group of consultants which may have been able to assist have been of extensive assistance to me with the writing of this thesis. I refer to the staff of the Production Technology Department of Massey University. I wish to thank Harvey Barraclough for his guidance especially in the wider thinking of how this concept could be applied to other computer systems and Roger Browne for his guidance in the writing of this thesis.

I wish to thank Ned Davies, the contract programmer for EXICOM, who made this concept a reality. During previous projects Ned had given me a good grounding on how the PICK system file structures worked and generally taught me how to use the programming language. At that stage, as I was not permitted to write software code for the corporate computer, I had to rely on Ned's ability to translate my concepts into a robust useable code. He acted as a good sounding board for some of my ideas which initially sounded impossible. His teaching, combined with my own reading, was sufficient to allow me to take over all the programming tasks and maintain the system when his contract was reduced due to changes in the company financial situation.

Lastly I wish to thank my family who have lived with this study for two years. Without their continuing support and understanding this thesis would not have been possible.
# TABLE OF CONTENTS

## INTRODUCTION

1. **Background** ............................................................................. 1

## 1.2. Information Needs

1. **Parts Listings** ........................................................................ 2
   1.2.1. **Historical** ................................................................. 2
   1.2.2. **Present** .................................................................... 3
   1.2.3. **Future** ..................................................................... 3
2. **Engineering Drawings** ............................................................ 3
   1.2.2.1. **Circuit Diagrams** .................................................. 3
   1.2.2.2. **Printed Circuit Boards** .......................................... 4
3. **Materials Nomenclature** .......................................................... 4
4. **Product Structure** ................................................................. 5
5. **Manufacturing Processes** ......................................................... 5
6. **Tooling** ................................................................................ 5
7. **Jigs and Fixtures** .................................................................. 5
8. **Work Instructions** ................................................................. 6
9. **Serial Numbers** .................................................................... 6
10. **Costing** .............................................................................. 6
11. **Inventory** ........................................................................... 6

## 1.3. Development of Computerised Systems

1. **Requirements Planning** ........................................................... 7
   1.3.1.1. **Independent Demand** ........................................... 7
   1.3.1.2. **Dependant Demand** ............................................. 7
   1.3.1.3. **Explosion Chart or Planning Matrix** ....................... 8
   1.3.1.4. **Common Parts** ...................................................... 9
2. **Data Elements of Bills of Material** .......................................... 9
   1.3.2.1. **Item Master Data** .................................................. 9
   1.3.2.2. **Product Structure Data** ........................................ 9
3. **Material Requirements Planning (MRP)** .................................. 10
4. **Modularisation of the BOMs** .................................................. 11
5. **Computer Memory Restrictions** .............................................. 13

## 1.4. Simple Example to Demonstrate EXICOM Situation

1. **Replacement of an Optional Part** .......................................... 16
2. **Replacement of a Common Part** ............................................ 16
3. **Affect on the Matrix BOM** ..................................................... 17
4. **Introduction of a New Option** ................................................ 17

Translation between files to obtain information for ACCESS enquiries

Entity-Relationship Data Model showing the two files used. The major attributes are listed against the applicable files.

BOM.HEADER file showing a typical logical view for a Generic BOM based on Figure 5.1.

BOM.HEADER file showing a typical logical view for a Phantom C0100 BOM.

BOM.HEADER file showing a typical logical view for a MINI-BOM.

BOM.DETAILS showing a typical logical view for a Generic BOM*Ref or a C0100-*Ref based on Figure 5.1. The date would normally be stored in internal format.

BOM.DETAILS file showing typical logical view for an Mini-BOM.

A possible screen display of the BOM listed in Figure 5.1 with all variants current. The variants have been sorted into ZZZZZ order.

A possible screen display of the BOM listed in Figure 5.1. In this case Variant 1 has an Obsolete flag set in the MATERIAL File.

A possible screen display of a C0100- assembly with all variants current. Description is read from the MATERIAL File.

A possible screen display of a Mini-BOM. Description is read from the MATERIAL File.

A possible screen display of the Index showing references read from BOM.DETAILS and descriptions read from MATERIAL.

A possible screen display of the Index showing a new reference R3 added through the Change Order procedure.
7.13 A possible screen display of the BOM for Advance Manufacture

7.14 A possible screen display of a Mini-BOM with references as listed on the drawing

7.15 Possible BOM.DETAILS display of Figures 5.1 and 7.5 showing all products and parts

7.16 Possible BOM.DETAILS display of Figures 5.1 and 7.5 showing all products but only valid parts for the effectivity date shown

7.17 Possible BOM.DETAILS display of Figures 5.1 and 7.5 showing all products and parts. An effectivity date has been included, in external format as in Figure 7.5

8.1 Navigation through RBOM

8.2 Against C0201-27266 in the BOM INDEX screen input M for Matrix display to see details of which variants use the Mini-BOM

8.3 Further explosion of the Mini-BOM is actioned by the input of an M for Matrix against the line entry

8.4 Recursive explosion of a Mini-BOM from the generic BOM. The BOM.HEADER is suppressed

8.5 BOM.DETAILS with Variants Option. The option flag is positioned below the vertical ZZZZZZ of the applicable variant

8.6 BOM.DETAILS with Effectivities Option. The effectivity is shown in external format for ease of understanding. Normally this would be in internal format

8.7 BOM.DETAILS with Descriptions Option. The description within the MATERIAL file is displayed for each part. The option flag for the last displayed part (Part9) is written
8.8 Screen display of all variants including obsolete. The word Obsolete is displayed to advise the user.

8.9 Screen display of non-obsolete variants only.

8.10 BOM.DETAILS with Effectivities Option. The Hide switch is on and only current parts are shown.

8.11 BOM.DETAILS with Effectivities Option. The Hide switch is off and all parts are shown.

8.12 Printed Circuit Board showing a Functional Block. All these components may need to change although the true change is only within the functional block.

8.13 Part9 is to be copied (+) and closed. The new part is Part7 which will have an effectivity start of today - 06.11.91.

8.14 Part7 has replaced Part9 from 06.11.91. The effectivity close for Part9 is one day earlier.

8.15 Part7 has been substituted for Part9 on the production run with an effectivity of 10.10.91. The effectivities show Part7 to be the current for variant 01123 on this date.

8.16 Indented BOM showing parts for all levels.

8.17 Indented BOM showing only the parts common for the selected variants for all levels.

8.18 Indented BOM showing only the non-common parts for the selected variants for all levels.

8.19 Indented BOM showing all parts for M00# M003-010 for all levels.

8.20 Indented BOM showing comparison between two variants for the same effectivity. Only non-common parts are listed at all levels.
8.21 Indented BOM showing comparison between the same variant at different stages of evolution. Only non-common parts are shown for all levels.

8.22 Indented BOM showing explosion of lower levels

8.23 Single Level parent BOM

8.24 Single Level BOM for the C0100 sub-assembly

9.1 Forecasts for November and December deliveries

9.2 Screen display for Part 2 showing forecast requirements. The Date Req'd (Mfg GIS) gives 6 weeks from the first picking date until the first delivery for the month

9.3 Requirements Report showing only those parts where an insufficient quantity is in stock or on order. These quantities are for the specified month only and are not aggregated

9.4 Back/Forward Orders showing all proposed movements for Part 42

9.5 Forecasts after adjustment to suit actual Customer Sales received

9.6 Back/Forward Orders now show sufficient product forecast to satisfy all known Customer Sales

9.7 A section of a Production Schedule Report. Daily Kanban rate of 10 per day

9.8 BOM showing Part 10 is substituted for an effectivity of 08.12.92 in place of Part 9

11.1 BOM.DETAILS screen display showing up to 40 variants with one spare column between each variant

11.2 BOM.DETAILS screen display showing over 40 variants without a spare column between each variant
11.3 Indented BOM showing groups of 1 allowing 40 columns .................. 162
11.4 Indented BOM showing groups of 3 allowing 60 columns .............. 162
11.5 Indented BOM showing groups of 5 allowing 66 columns .............. 163
