## ABSTRACT

The effects of heat treatment at temperatures in the range 80 - 140°C for 4 s in a spiral flow indirect UHT plant on (i) the denaturation of whey proteins, (ii) their association with the casein micelles and incorporation into rennet gels and (iii) rennet coagulation properties of skim milk were determined.

The extent of denaturation of  $\beta$ -lactoglobulin ( $\beta$ -Lg) and  $\alpha$ -lactalbumin ( $\alpha$ -La), as determined by the decrease in the amounts of native protein (Native-PAGE) in the ultracentrifugal supernatants (100,000g for 1 h) of heated milks, increased with the severity of heat treatment. At all temperatures,  $\beta$ -Lg was more sensitive to thermal denaturation than  $\alpha$ -La. The extent of association of  $\beta$ -Lg and  $\alpha$ -La with the casein micelles, as determined by the total amounts of these proteins (SDS-PAGE) remaining in the ultracentrifugal supernatants of heated milks, also increased with the severity of heat treatment. At any given temperature, association of these proteins with casein micelles was much less than the amount that denatured. The extent of incorporation of  $\beta$ -Lg and  $\alpha$ -La into rennet gels increased with temperature and could be related to the levels of denaturation of  $\beta$ -Lg and its association with casein micelles.

Heat treatment impaired the rennet coagulation properties of milk as indicated by an increase in gelation times and a decrease in gel strengths (both determined using the Bohlin VOR Rheometer). There was a close correlation between the extents of association of  $\beta$ -Lg with the casein micelles and the changes in gelation time or gel strength. When heated milks were acidified to pH 5.5 and re-neutralised to pH 6.5 (pH cycled), the adverse effects of heat treatment on rennet coagulation were reduced, except for those milks heated at temperatures above 120°C. The rennet coagulation properties of heated milks were markedly improved by addition of low concentrations of  $\text{CaCl}_2$ , but no additional improvement

resulted when  $\text{CaCl}_2$  addition was combined with pH cycling.

Concentration of skim milk by ultrafiltration (UF) lengthened gelation time but increased gel strength, the effect being dependent on the volume concentration ratio (VCR). Heat treatment of milk ( $140^\circ\text{C}$  for 4 s) before or after UF increased gelation times and lowered gel strengths with weaker gels being formed from milks heated prior to UF. pH cycling of heated milk before UF or of heated UF concentrates had an adverse effect on rennet coagulation properties of the UF concentrates. When 3X UF concentrate was heated at temperatures in the range  $80 - 140^\circ\text{C}$  for 4 s, gelation time did not change with temperature between  $80$  and  $120^\circ\text{C}$  but more severe heat treatments caused an increase. In contrast, the gel strength decreased gradually with increase in heating temperature. These changes in rennet coagulation properties were related to the extent of denaturation of  $\beta$ -Lg and its association with the casein micelles.

## ACKNOWLEDGEMENTS

I would like to express my deepest appreciation to my supervisor, Dr. Harjinder Singh, for introducing me to this subject and for his unfailing commitment, support and expert advice in all stages of this research project. I am also grateful for the encouragement and constructive criticism received from my co-supervisor, Mr Rod Bennett, especially during compilation of this manuscript.

Ms June Latham is greatly acknowledged for her help on the Bohlin Rheometer and her patience and willingness to be called up at home (often at odd hours) to come and tend to minor difficulties with the machine. The technical assistance received from Messrs Steve Glasgow, Alistair Young, Garry Radford and Byron McKillop is greatly appreciated as is the help received from other members of staff in the Food Technology department.

I would like to thank my fellow graduate students for their friendship and helpful discussions on aspects of my study particularly David Oldfield for his assistance in the techniques of gel electrophoresis.

I enjoyed some great Kiwi hospitality over my two years in New Zealand from the following families to whom I extend a big thank you: Mr and Mrs W. Gartner, Mr and Mrs R. van Laar-Veth, Mr and Mrs A. Schaw and Mr and Mrs J. van Laar.

Special thanks are due to Jackie Gezimati for her continued friendship and to my family for their support and encouragement throughout my studies.

Finally, I would like to thank the New Zealand Ministry of Foreign Affairs and Trade for financing both my stay and study in New Zealand through the award of an ODA Scholarship.

## LIST OF FIGURES

Figure	Title	Page
2.1	Structure of the casein micelle.	5
5.1	Loss of native $\beta$ -Lg ( $\circ$ ) and $\alpha$ -La ( $\blacktriangle$ ) from the ultracentrifugal supernatants (100,000g for 60 min) obtained from skim milk heated at temperatures in the range 80 - 140°C for 4 s (estimated using quantitative Native-PAGE).	46
5.2	Changes in the amounts of total $\beta$ -Lg ( $\circ$ ) and $\alpha$ -La ( $\blacktriangle$ ) (native and aggregated) remaining in the ultracentrifugal supernatants obtained from skim milk heated at temperatures in the range 80 - 140°C for 4 s (estimated using quantitative SDS-PAGE).	46
5.3	Relationship between loss of native $\beta$ -Lg (from Figure 5.1) and the changes in the amounts of non-sedimentable $\beta$ -Lg (from Figure 5.2).	48
5.4	Influence of pH at heating on the amounts of total $\beta$ -Lg ( $\circ$ ) and $\alpha$ -La ( $\blacktriangle$ ) (native and aggregated) remaining in the ultracentrifugal supernatants (estimated using quantitative SDS-PAGE). Heat treatment was at 140°C for 4 s.	50
5.5	Influence of pH at heating on the formation of non-sedimentable $\kappa$ -casein (estimated using quantitative SDS-PAGE) on heating skim milk at 140°C for 4 s.	50
5.6	Changes in the amounts of residual $\beta$ -Lg ( $\circ$ ) and $\alpha$ -La ( $\blacktriangle$ ) in rennet whey obtained from skim milk heated at temperatures	

- in the range 80 - 140°C for 4 s (estimated using quantitative SDS-PAGE). 53
- 5.7 Influence of pH at heating on the amount of residual  $\beta$ -Lg ( $\circ$ ) and  $\alpha$ -La ( $\blacktriangle$ ) in rennet whey (estimated using quantitative SDS-PAGE). Heat treatment was at 140°C for 4 s. 53
- 5.8a Relationship between native  $\beta$ -Lg (Figure 5.1) and residual  $\beta$ -Lg in rennet whey (Figure 5.6). 55
- 5.8b Relationship between residual  $\beta$ -Lg in rennet whey (Figure 5.6) and non-sedimentable  $\beta$ -Lg (Figure 5.2). 55
- 5.9 The changes of moduli and phase angle with time during the development of rennet gels. Complex modulus,  $G^*$  ( $\bullet$ ); storage modulus,  $G'$  ( $\circ$ ); loss modulus,  $G''$  ( $\blacksquare$ ); phase angle,  $\delta$  ( $\Delta$ ). Zero time indicates addition of rennet. 58
- 5.10 The changes in gel strength ( $G'$ ) with time during rennet coagulation of heated skim milks. Unheated control skim milk ( $\circ$ ), skim milk heated at 80 ( $\bullet$ ), 90 ( $\square$ ), 100 ( $\blacksquare$ ), 110 ( $\Delta$ ), 120 ( $\blacktriangle$ ), 130 ( $\nabla$ ) or 140°C ( $\blacktriangledown$ ) for 4 s. 58
- 5.11 Gelation times (GT) of skim milks which have been heated for 4 s at temperatures in the range 80 - 140°C. 60
- 5.12 Gel strengths,  $G'$ , ( $\square$ ) and rates of curd firming  $K$ , ( $\blacksquare$ ) for skim milks which have been heated for 4 s at temperatures in the range 80 - 140°C. 60
- 5.13 Influence of pH at heating on the changes in  $G'$  with time. Skim milk samples were adjusted to pH 6.4 ( $\blacksquare$ ), 6.6 ( $\Delta$ ), 6.8

- (▼), 7.0 (◇) or 7.3 (★) and heated at 140°C for 4 s. The pH of all samples was readjusted to 6.5 before renneting. 62
- 5.14 Gelation times of skim milks which have been adjusted to pH values in the range 6.4 - 7.3 and heated at 140°C for 4 s. Heated samples (■), unheated control (□). The pH of all samples was readjusted to 6.5 before renneting. 62
- 5.15 Gel strength,  $G'$ , (□) and rate of curd firming,  $K$ , (■) for skim milks which have been adjusted to pH values in the range 6.4 - 7.3 and heated at 140°C for 4 s.  $G'$  for unheated control (○),  $K$  for unheated control (●). Renneting was carried out for all samples at pH 6.5. 64
- 5.16 The pH-dependent reversibility of the amounts of non-sedimentable  $\beta$ -Lg and  $\kappa$ -casein. Amounts of non-sedimentable (100,000g for 60 min)  $\beta$ -Lg (○) and  $\kappa$ -casein (▲) at the heating pH. Amounts of non-sedimentable  $\beta$ -Lg (●) and  $\kappa$ -casein (△) after readjustment to pH 6.5. 66
- 5.17 Relationship between residual native  $\beta$ -Lg (○) (from Figure 5.1), or non-sedimentable  $\beta$ -Lg (●) (from Figure 5.2) and gelation time (from Figure 5.11). 67
- 5.18 Relationship between the amounts of residual native  $\beta$ -Lg (○) (from Figure 5.1) or non-sedimentable  $\beta$ -Lg (●) (from Figure 5.2) and gel strength ( $G'$ ). 70
- 5.19 Relationship between residual native  $\beta$ -Lg (○) or non-sedimentable  $\beta$ -Lg (●) and  $G'$  or GT. 70

- 6.1 Experimental procedure for determining the effects of acidification and subsequent reneutralisation (i.e. pH cycling) on the rennet coagulation properties of heated milks. 75
- 6.2 Gelation times (GT) of skim milks heated at temperatures in the range 80 - 140°C for 4 s (□). Heated skim milks adjusted to pH 5.5, left for 2 h at 20°C, and readjusted to pH 6.5 (■). All heated samples were renneted at pH 6.5. 76
- 6.3 Gel strengths,  $G'$ , (□) and rates of curd firming,  $K$ , (Δ) of skim milks heated at temperatures in the range 80 - 140°C for 4 s.  $G'$  (■) and  $K$  (▲) of heated skim milks adjusted to pH 5.5, left for 2 h at 20°C, and readjusted to pH 6.5. 76
- 6.4 Gelation times (GT) of skim milks heated at 140°C for 4 s at pH values in the range 6.4 - 7.3 (■). Skim milks heated at 140°C for 4 s at pH values in the range 6.4 - 7.3, acidified to pH 5.5, left for 2 h at 20°C, and readjusted to pH 6.5. Raw skim milk (Δ), raw skim milk acidified to pH 5.5, left for 2 h at 20°C, and readjusted to pH 6.5 (▲). All samples were renneted at pH 6.5. 80
- 6.5 Gel strengths,  $G'$ , (□) and rates of curd firming,  $K$ , (○) of skim milks heated at 140°C for 4 s at pH values in the range 6.4 - 7.3.  $G'$  (■) and  $K$  (•) of milks heated at different pH values, acidified to pH 5.5, and reneutralised to pH 6.5.  $G'$  (Δ) and  $K$  (▲) for raw skim milk.  $G'$  (▽) and  $K$  (▼) for raw milks which have been acidified to pH 5.5 and reneutralised to pH 6.5. 80

- 6.6 Experimental procedure for the determination of the effects of acidification and reneutralisation (pH cycling), addition of  $\text{CaCl}_2$  or combined effect of pH cycling and  $\text{CaCl}_2$  addition on rennet coagulation properties of heated milks. 82
- 6.7 Influence of  $\text{CaCl}_2$  addition on the changes in  $G'$  with time during renneting of heated ( $140^\circ\text{C}$  for 4 s) and unheated milks. Unheated milk with no  $\text{CaCl}_2$  added ( $\circ$ ), 1mM  $\text{CaCl}_2$  added ( $\bullet$ ), or 2mM  $\text{CaCl}_2$  added ( $\square$ ). Heated milk with no  $\text{CaCl}_2$  added ( $\blacksquare$ ), 1mM  $\text{CaCl}_2$  added ( $\nabla$ ), or 2mM  $\text{CaCl}_2$  added ( $\blacktriangledown$ ). 83
- 6.8 The combined effect of acidification and reneutralisation (pH cycling) and  $\text{CaCl}_2$  addition on the changes of  $G'$  with time during renneting of heated milk ( $140^\circ\text{C}$  for 4 s). No  $\text{CaCl}_2$  added- raw milk (control) ( $\circ$ ), heated milk ( $\blacksquare$ ); heated milk with 2mM  $\text{CaCl}_2$  added ( $\nabla$ ); heated and pH cycled milk with no  $\text{CaCl}_2$  added ( $\square$ ); or heated and pH cycled milk with 2mM  $\text{CaCl}_2$  added ( $\bullet$ ). 86
- 7.1 The changes in gel strength ( $G'$ ) with time during renneting at (A) natural pH of normal skim milk ( $\circ$ ), 2X UF concentrate ( $\square$ ) or 3X UF concentrate ( $\Delta$ ) and (B) at pH 6.50 of normal skim milk ( $\bullet$ ), 2X UF concentrate ( $\blacksquare$ ) or 3X UF concentrate ( $\blacktriangledown$ ). 91
- 7.2 Experimental procedure for the effect of UHT treatment and pH cycling on the rennet coagulation properties of milk concentrated by UF. 95
- 7.3 The changes in  $G'$  with time during renneting at pH 6.5 of (A) unheated normal milk ( $\circ$ ), 2X UF concentrate ( $\square$ ), 3X UF

- concentrate ( $\Delta$ ) or (B) UHT treated normal milk ( $\bullet$ ), 2X UF concentrate ( $\blacksquare$ ), 3X UF concentrate ( $\blacktriangle$ ) and UHT treated and pH cycled normal milk ( $\diamond$ ), 2X UF concentrate ( $\blacklozenge$ ) or 3X UF concentrate ( $\star$ ). Unheated normal milk ( $\circ$ ) is also shown in (B). 96
- 7.4: Experimental procedure for determination of the effect of concentration by UF on the rennet coagulation properties of UHT treated milk. 100
- 7.5 The changes in gel strength ( $G'$ ) with time during renneting of unheated normal milk ( $\circ$ ), normal milk UHT treated before UF to VCR 2X ( $\Delta$ ), 3X ( $\nabla$ ), normal milk UHT treated and pH cycled ( $\blacksquare$ ), normal milk UHT treated and pH cycled before UF to VCR 2X ( $\blacktriangle$ ) or 3X ( $\blacktriangledown$ ). 101
- 7.6 The changes in gel strength ( $G'$ ) with time during renneting coagulation of heated 3X UF concentrates. Unheated control 3X UF concentrate ( $\circ$ ), UF concentrate (3X) heated at 80 ( $\bullet$ ), 90 ( $\square$ ), 100 ( $\blacksquare$ ), 110 ( $\Delta$ ), 120 ( $\blacktriangle$ ), 130 ( $\blacktriangledown$ ) or 140°C ( $\nabla$ ) for 4 s. 106
- 7.7 Relationship between residual native  $\beta$ -Lg ( $\circ$ ), or non-sedimentable  $\beta$ -Lg ( $\bullet$ ) and gelation time. 109
- 7.8 Relationship between the amounts residual native  $\beta$ -Lg ( $\circ$ ) or non-sedimentable  $\beta$ -Lg ( $\bullet$ ) and gel strength ( $G'$ ). 109
- 8.1 Schematic diagram of the attack on casein micelles by rennet. 114
- 8.2 Schematic diagram of the effect of heat treatment of milk on the attack on casein micelles by rennet. 116
