Women's decision making process about Hormone Replacement Therapy in the New Zealand context

A thesis presented in partial fulfilment of the requirements for the degree of Master of Arts in Psychology at Massey University Turitea, Palmerston North New Zealand

Wendy Lena Radford

2003
ABSTRACT

The transitional time of menopause has differential meanings for mid-aged women around the world. The medicalisation of menopause has resulted in the increasing promotion of hormone replacement therapy (HRT) both to alleviate distressing symptoms and prevent future illnesses. It is against a background of constantly changing information that women have to make a complex decision about the benefits and risks of this therapy for short and long term use. The theory of planned behaviour (TPB) (Ajzen, 1985) has been successful in predicting a range of health behaviours but few studies have been conducted to assess its predictive validity on intention to take HRT and to date there has been no assessment of this model in the New Zealand context. The present study was undertaken to discover the factors that influenced decision making about HRT use in New Zealand and to predict women’s intention to take it at menopause by applying the TPB. A cross sectional postal survey of 140 mid-aged women randomly selected from the General and Māori electoral rolls measured attitudes, subjective norms and perceived behavioural control as well as moral norms and similar prior behaviour. Results of hierarchical multiple regression analysis supported the utility of the TPB to predict intention to use HRT and also showed that moral norms made a significant independent contribution to the prediction of intention to use HRT. The most important factors that influence New Zealand women’s intention to use HRT are both the views of people who are important to them and their own attitudes to this treatment. Having a personal sense of control over following the HRT regime and believing it is right to do so and not a sign of weakness are also important considerations. Taking the contraceptive pill in the past has no influence on the decision making process about future HRT use.
ACKNOWLEDGEMENTS

I would like to thank Dr Christine Stephens, my supervisor, for welcoming me to the project team, her enthusiasm for quantitative research and her wealth of knowledge.

I am forever grateful to my husband, Graham, and daughters, Susannah and Claire, for their encouragement and love over many years of extramural study and their belief in me.

I would like to express my appreciation of all my colleagues at Voyagers who have supported me throughout this process, in particular Dr Gwenllian Parry, Amelia Brown and Veerle Poels.

I would also like to acknowledge and thank the women in New Zealand who so generously gave their time to complete the questionnaire and provide insight into their decision making about HRT. Approval for this research was obtained from Massey University Human Ethics Committee.

### Chapters Overview

**CHAPTER TWO: METHOD**
- **Sample**...........................................54
  - Statistical analyses.................................55
- **Sample Description**..............................55
- **Procedure/Research Design**....................58
- **Measures**.........................................60
  - Behavioural Intention...............................60
  - Attitude............................................61
  - Subjective norms..................................62
  - Perceived behavioural control....................62
  - Moral norms........................................63
  - Similar prior behaviour............................64

**CHAPTER THREE: RESULTS**..............................66
- **Descriptive Statistics**..........................66
  - Correlations between predictors...................67
  - Predictive utility of the extended TPB...........70

**CHAPTER FOUR: DISCUSSION**..........................73
- **Review of Specific Findings**...................73
  - Applicability of the predictors of the theory of planned behaviour on intention to use HRT........73
  - Importance of the variables of the theory of planned behaviour..................74
    - Attitudes and subjective norms..................74
    - Perceived behavioural control..................77
