Abstract

Mental health is of utmost importance in military settings due to the demanding and often dangerous nature of the work involved. However, military personnel are disproportionately deterred from seeking mental health help when the need arises. Perceived stigma and structural barriers to help seeking have been widely researched in military settings, however, results are often mixed. The current study examined the traditional stigma and structural barriers help seeking model alongside an alternative model of the Theory of Planned Behaviour to explain help seeking behaviour. A cross-sectional study design surveying 2633 enlisted New Zealand Defence Force Personnel was carried out. Within the two models, attitudes, subjective norms, perceived behavioural control, stigma, and structural barriers were assessed as predictors of intentions to seek professional help for mental health problems. The Theory of Planned Behaviour model accounted for 26% of total variance in help seeking intentions, while the traditional model only accounted for 7%. Additionally, the Theory of Planned Behaviour model showed potential for its capacity to include stigma and structural barriers as antecedents to its core predictors, with stigma being partially mediated by attitudes, and structural barriers being fully mediated by perceived behavioural control.

Additional group level measures were also considered in relation to help seeking intentions which highlighted at risk groups. A common theme arose across these groups of less chances for both formal and informal learning opportunities about mental health help seeking in the defence force. Using these group level differences, recommendations for how the Theory of Planned Behaviour can be utilized to increase mental health learning experiences for the New Zealand Defence Force personnel are made. Specifically, the potential efficacy of incorporating the sharing of highly ranked personnel’s positive experiences of help seeking early on in new recruits training.
Acknowledgements

Firstly, I would like to thank my supervisor Dr Mei Wah Williams from the School of Psychology at Massey University. She allowed this work to be my own, while supporting me through the research process. She is a leader in her field with many publications and I am very grateful to have had her as a mentor. Her attention to detail and high standards were greatly appreciated.

I would also like to thank the New Zealand Defence Force and their personnel who carried out the survey. It’s a great honour to be involved with such an outstanding organisation that does so much for our Country and people. With a special mention to LTCOL Clare Bennett who was constantly there checking my methods, explaining military jargon and encouraging my ideas. Without her help this thesis would not have happened but just as importantly, it wouldn’t have been nearly as enjoyable.

I would also like to acknowledge my good friends James Richards and Hamish Speakman for their support and proof reading. I am gratefully indebted to both of you for your very valuable comments on this thesis.

Finally, I must express my very deep gratitude to my Dad and to my partner Andrew for giving me constant support and continuous encouragement throughout my years of study and during the process of researching and writing this thesis. This accomplishment would not have been possible without them. Thank you.
