2008**

## ABSTRACT

The increasing price of oil and the destabilisation of the world's climate are urging governments, businesses and individuals to constantly investigate energy-efficient technologies and methodologies and pursue the adoption of energy efficiency programmes in a global effort to reduce energy consumption, greenhouse gas emissions and ultimately energy costs.

In New Zealand, one of the biggest industrial energy efficiency projects was started in 2002 by a multinational dairy company, the Fonterra Co-operative Group, in partnership with the energy service company Demand Response Ltd; the project currently aims at reducing by 15% the energy costs at all Fonterra's major production sites throughout the country. This thesis, undertaken as part of the above project, examines the development and implementation of a structured and integrated energy monitoring and targeting methodology (M&T) for the most efficient operation of all Fonterra's chilled water systems, with an initial focus on the ones installed at Clandeboye, one of the Fonterra's sites involved in the energy saving project.

A data collection system (*Insite*) was already in place at Clandeboye to enable storage and analysis of some of the site's utility metering data. After identification of key chilled water system components and definition of data requirements for M&T purposes, an analysis of past energy consumption trends (based on multiple regression calculations) was carried out to develop an historical benchmark of the energy used, compare it with current energy performance and thus identify opportunities for future improvements. The creation of an M&T reporting system for presenting findings to operators and management was the last essential part of the thesis development.

The study has highlighted that the robustness of the proposed regression model was badly affected by the unreliability of the existing data collection system and the uncertainty associated with poorly documented changes to operating conditions/plant configuration that had occurred over time. The conclusion is that, while the developed M&T methodology is theoretically valid and readily applicable, further developments are necessary (and recommended) to make it suitable for other similar systems.

## **ACKNOWLEDGEMENTS**

I wish to thank my thesis supervisors, Prof. Don Cleland, Dr Richard Love and Dr Wyatt Page, for providing me with much needed support and encouragement throughout the development of this project. Their guidance has been invaluable.

I am also pleased to acknowledge the assistance of all Demand Response engineers, who gave me their time and resources to help me understand their work with Fonterra and build my knowledge of their database.

My thanks also go to Christine Lang, the Fonterra Process Technologist at Clandeboye who was my main point of contact on site and an essential source of system information and data.

My sincere gratitude goes to Allan Davidson, my managing director, who not only accommodated flexible working arrangements but also gave me his unconditional support, which translated into the necessary concentration and tranquility to keep working on this project even at times of high workload.

Finally, my hearty thanks go to my husband Dominic, who patiently and understandingly shared his wife with this demanding project and to my parents in Italy, whose constant love and encouragement has given me the strength to persevere and eventually complete this thesis.

# TABLE OF CONTENTS

<b>CHAPTER 1 – INTRODUCTION .....</b>	<b>1</b>
1.1 Project Background .....	1
1.2 Project Objectives.....	3
<b>CHAPTER 2 – CHILLED WATER SYSTEMS .....</b>	<b>4</b>
2.1 Introduction.....	4
2.2 Chilled water.....	4
2.3 The Mechanical Vapor-Compression Refrigeration Cycle .....	5
2.3.1 Performance of a Refrigeration Cycle.....	10
2.4 Refrigeration System Components.....	12
2.4.1 Compressors .....	12
2.4.2 Condensers .....	18
2.4.3 Expansion Devices .....	21
2.4.4 Evaporators .....	23
2.5 Clandeboye’s Chilled Water Systems.....	25
2.5.1 Powder Chilled Water Plant.....	26
<b>CHAPTER 3 – MONITORING AND TARGETING.....</b>	<b>32</b>
3.1 Introduction.....	32
3.2 M&T Key Elements.....	33
3.2.1 Data Collection .....	34
3.2.2 Data Analysis.....	35
3.2.3 Reporting of Findings .....	40
3.3 Conclusions.....	41
<b>CHAPTER 4 – DATA COLLECTION .....</b>	<b>42</b>
4.1 <i>Insite</i> – The Existing Database.....	42
4.2 Additional Data Sources .....	44
4.3 Data Identification and Collection .....	47
4.3.1 Process Heat Exchangers .....	48
4.3.2 Chilled Water Flows.....	50
4.3.3 Supply and Return Chilled Water Temperatures .....	51
4.3.4 Electricity to Chillers and Ancillary.....	53
4.3.5 Chillers’ Data .....	54
4.3.6 Outside Temperature/Humidity Data .....	54
4.4 Data Collection Issues.....	55
4.4.1 Milk and Product Flows Uncertainty .....	55
4.4.2 Incorrectness of Chilled Water Flow Data .....	56

4.4.3	Purging of Electricity Data .....	56
<b>CHAPTER 5</b>	<b>– CREATING BENCHMARKS .....</b>	<b>58</b>
5.1	Introduction.....	58
5.2	Identification of variables .....	59
5.3	Data Set .....	61
5.3.1	Data Aggregation .....	62
5.3.2	Multicollinearity .....	62
5.3.3	Outliers .....	65
5.4	Regression Analyses.....	67
5.5	Benchmarking equation.....	70
5.6	Initial model test .....	71
<b>CHAPTER 6</b>	<b>– THE REPORTING SYSTEM .....</b>	<b>73</b>
6.1	Introduction.....	73
