Investigating the use of the PERMA theory of wellbeing in the New Zealand General Social Survey

A thesis presented in partial fulfilment of the requirements for the degree of Master of Arts in Psychology at Massey University, Albany, New Zealand

Jared Campbell Viljoen

2018
Abstract

In recent years governments have become increasingly interested in measuring the overall wellbeing of their populations. This is a significant shift away from the traditional focus on economic metrics. With the development of its General Social Survey, the New Zealand government has followed this trend. A popular wellbeing measure used by many, including in the New Zealand General Social Survey, is the single satisfaction with life question. There are challenges with relying on life satisfaction to measuring subjective wellbeing. This research investigates the use of Martin Seligman’s PERMA theory of wellbeing as a potential alternative for the life satisfaction question, as it provides extra information about wellbeing while potentially also not losing information gained through measuring life satisfaction. It also may help understand better cross-cultural differences in wellbeing. 100 New Zealand European and New Zealand Māori participants aged 55-64 years old responded to a postal survey asking them about their wellbeing. The life satisfaction question and the questions from the PERMA theory were asked. Statistical correlation was used to analyse the data. Results indicated that PERMA questions do potentially provide and enhanced understanding of wellbeing, both within and across cultures, without losing information gained through use of the life satisfaction question. Using PERMA in a survey like the New Zealand General Social Survey could potentially provide an increased understanding of not only whether people are ‘happy’, but why they are ‘happy’, and how different cultures experience that ‘happiness’.
Acknowledgements

Firstly, I thank the university, and the School of Psychology for their funding in supporting the research which, for a cash strapped small family, was greatly appreciated. I also thank my supervisor Michael Philipp for his support in the early development of this work, even though for much of the time it would have seemed that his student was MIA. He was ever positive and understanding. Heartfelt thanks must also be paid to the 100 participants who took time out of their lives to answer what must have appeared rather strange and unexpected questions. Their willingness to share a portion of themselves made this work possible. I also must thank my four children who were often absent a father and, even when he was present, would have appeared pre-occupied with work or his ‘homework’. Their sacrifice has not gone unnoticed nor will go unrewarded; Story time will well and truly return. Of particular and prime importance, I must acknowledge the unwavering support of my wife without whom this thesis would have been abandoned many times. It has been an unexpectedly long and challenging journey but, whatever the outcome, the fact that it was submitted was in large part due to her patience, her tough-love, and her unwavering faith. She is both the stick and the carrot wrapped into a singularly stunning and profound package. Always, you are my ‘Great Lady of Truth’. Finally, I humbly thank my Heavenly Father who has truly taught me more about ‘wellbeing’ than all the books in the world. As always, it was less my faith in Him and more His faith in me that lead to the submission of something rather than nothing. It has been a journey.
