My success should not be bestowed onto me alone, as it was not individual success but success of a collective

Everything good in life stems from a firm foundation and a great upbringing. I am fortunate to have had both, so I wanted to start by acknowledging the role my beautiful parents have played in providing me with such great opportunities, and instilling into a young girl the qualities that have allowed me to persevere and achieve as an adult something that I never dreamed I could. My sister Beverley has also been an integral part of that journey, not only as my older sibling and role model, but also as my best friend. I thank her for her ongoing positivity and encouragement. The relentless support she and her husband James have given me throughout this process have never wavered. At times I think she believed more than I did that I could actually do it!

Although completing a thesis was always part of the course programme, I never imagined that I would be able to research a topic that I was really passionate about while being mentored by such a talented, generous, and encouraging supervisor. Veronica made this happen. She supported me throughout this journey and I feel very privileged that I was able to learn and be inspired by her. She is truly a great New Zealander, and someone I now call a friend. I look forward to many more talks with her about her love for Winston Peters and sharing stuff about our families. They are always great conversations.

There are many people who have contributed in some way to making this project happen. To all the caregivers: without your dedication to providing children in care with the love and nurturing they require, this project would never have happened. To Bianca and John: for being the best second parents anybody could ask for, and for John’s invaluable contribution
to the final stages of this project. To my great friends and personal support systems, Gill and David Parrott, Katie and Brendon Pritchard, Sarah Williams, Linzi Heaney and Jo Stevenson: they have all played a fundamental role in supporting me to achieve, and for that I thank them. To the Health Research Council of New Zealand: thank you for believing in the importance of my research topic, and for providing financial support so I could focus on my studies.

Of course, I have saved the best for last: Michael, Oscar, Samuel, and Jesse, my beautiful, loving, supportive, encouraging, and amazing family. It is so difficult to put into words how they have contributed to this achievement. I am so blessed to have a partner in life who believes in me and encourages and supports me every day to accomplish my dreams. I know this journey has not been easy at times (as I am so often reminded by others who say, “Poor old Mike”). All I can say is, “Thank you for hanging in there,” and “Look out, my new psychology skills are going to help me win a lot more arguments!” Finally, to my three babies, who are my universe: I hope that watching Mummy “do her study” has provided them with some positive life lessons, taught them to strive to be the best people they can be, to always believe in themselves, and to work hard so all their dreams may come true. I look forward to now having every day to focus solely on being their mummy.
Abstract

The purpose of this study was to expand on foster care and attachment literature by investigating how the relationship is impacted between a foster caregiver and newborn who experiences feeding difficulties. The most common types of feeding difficulties experienced include reflux, allergies, colic, arousal to feed, and sucking problems, with prenatal methamphetamine exposure being the most frequently cited reason for causality. Newborns who have been prenatally exposed to methamphetamine are at higher risk of preterm births. Prematurity has been widely associated with developmental issues in newborns, such as poor sucking reflexes. All newborns discussed in this study were of Māori descent, highlighting a possible association between Māori children in care and feeding difficulties. This association is thought to be strengthened by the social determinants faced by many Māori, and the punitive neo-liberal nature of the welfare system. Phenomenological interpretive analysis was used to understand the experiences of seven foster caregivers who were highly skilled in caring for newborns with feeding difficulties, and how the feeding difficulties could impact the attachment relationship and contribute to placement breakdowns. Additionally, the strategies that foster caregivers used to minimise the impact of the difficulty and optimise attachment interactions were explored. The feeding difficulties of newborns were found to make attachment interactions more difficult to achieve, but due to the fortitude of the caregivers in providing the best opportunities for newborns in their care, attachment interactions were reportedly always accomplished. Although feeding difficulties placed extra demand on the caregiver role, the commitment and motivation of the caregivers, and the intervention strategies they used to reduce the impact, promoted bonding and stabilised placements. Therefore, feeding difficulties were not associated with placement breakdowns. Rather, unanticipated extended placement timeframes, which impacted the caregiver’s ability to provide a consistent and stable environment, were found to be more detrimental to the placement stability.
Understanding feeding difficulties and their impact on attachment for babies in foster care is crucial when caring for the nation’s most vulnerable citizens and ensuring that they have the greatest opportunities for healthy development from the start of their lives.
