# **Professional Supervision in a Community of Practice**

A thesis presented in partial fulfilment of the requirements  
for the degree of  
Doctor of Philosophy  
in  
Educational Psychology

Massey University, Albany Campus, Auckland  
New Zealand

Jean Annan  
2005

## *Declaration*

I declare that this thesis represents my own work except where due acknowledgement is made and that this material has not been included in a thesis or report submitted to Massey University or any other university for a degree or other qualification.

Jean Annan  
Candidate for PhD

## ***Abstract***

Previous research of supervision in educational psychology has regularly reported low rates of participation and dissatisfaction with the adequacy of supervisory arrangements. Most studies to date have been conducted on the assumption that supervision is a formalised, often one-to-one relationship. However, this view of supervision is incongruent with the ecological theories of human development that currently guide educational psychologists' work. The present study sought to develop understanding of the nature and contexts of supervision for a group of educational psychologists through examination of the actions they took to meet the goals of supervision. A situational analysis research method was used to examine the supervisory actions, in relation to the theories underlying current field practice, of 38 educational psychologists. This collaborative method of inquiry reflected the procedures of the psychologists' professional practice and enabled the understanding of supervision to be constructed using the participants' own sense-making processes. Results of the study indicated that the psychologists pursued the goals of supervision through the multiple interactions that took place within the regular activity of their community of practice. Supervision included a combination of formal, informal and situated interactions. It was concerned with connectedness to the professional community and comprised a range of integrated activities. The psychologists demonstrated that their supervision-in-action was guided by the same ecological principles that guided their professional practice. When supervision was conceptualised as a practice that included formal, informal and situated interactions intended to meet the goals of supervision, the participants reported high levels of satisfaction with current supervisory arrangements and participation in the practice. This thesis proposes an extended view of supervision that depicts supervision as activity situated within the interaction of a community of practice. It suggests that ecologically valid evaluations of supervision activity and the development of applicable systems of supervision must consider a wide range of supervision activities and contexts of practice.

## *Acknowledgements*

The construction of this thesis has been made possible through the contributions of many family members, friends, colleagues and authors. Firstly, I would like to thank those who participated in this study; the psychologists who contributed with reports of their supervision activity; members of the reference group who provided feedback on the theory of supervision; and the managers of Specialist Education Services (now Ministry of Education; Special Education) for facilitating the data collection and consultation process. In particular, I would like to thank Lewis Rivers for his support of this project from the outset.

I wish to thank Associate Professor Ken Ryba for sharing his valuable professional expertise and offering me support throughout the study. I am appreciative of his generosity and courage in giving me the latitude to conduct this study in a way that reflected the sense-making processes of the participants. I am also grateful for the supervision of Associate Professor Pat Nolan who encouraged me to take a broad view of the project, challenged me to get over the trials in composing a PhD and pressed me to actually get on and write it. Pat and Ken also prompted me to examine the detail of my work and instilled in me a determination to demonstrate the coherence of my theory.

The writing of a thesis would be an isolating experience if not for the support of family. It would be an impossible task to express my gratitude for the support of my husband Brian who coaxed me back to university, joined me on the PhD journey and kept me engaged in my work through on-going dialogue. I appreciate his willingness to understand both the bright and dark moments that are an inevitable part of extended study. Thank you to our two daughters, Rebecca and Kimberley, who have supported me with their patience, independence and explicit valuing of this learning. I also acknowledge the vital contributions of my late mother and father, Mary and Ian, who imparted their desire to acquire knowledge and understanding of the world through a combination of the written word and first hand experience. I appreciate also the input of my sister Gilly for her generous support for our

girls when I have been studying and for her ability to supportively challenge my personal theories.

Several writers have contributed to my sense of purpose and enthusiasm for social research by proposing particular understandings of the relations between people. In the early years of my university study, Colin Lankshear introduced me to the work of Paulo Freire, who presented a view of knowledge construction that made sense to me and inspired me to further my learning. Later, I was introduced by Stuart McNaughton to the views of the social interactionists, including Lev Vygotsky and Urie Bronfenbrenner, whose perspectives on human development located concerns in the interaction between people and their worlds.

Particular knowledge and tools were required to examine the context of supervision. In this regard, I acknowledge the work of Chris Argyris and David Schön who provided a means for discerning and interpreting these interactions. Viviane Robinson's *problem analysis* was a vital component of the present study as it provided a vehicle for the management and re-creation of meaning for entangled and disparate data sets. I also acknowledge the contributions of Jean Lave and Etienne Wenger, whose recognition of situated learning and description of the functioning of *communities of practice* has contributed so enormously to this thesis.

This study would not have been possible without funding to negotiate the project or to gather information and consult with the professional community on the applicability of the findings. I wish to thank the College of Education, Massey University, especially the Department of Learning and Teaching, for their ongoing support throughout the project. I am also grateful for the financial support made available through: (1) the Graduate Research Fund; (2) an Academic Women's Award; and, (3) an Advanced Degree Award.
