ABSTRACT

The objective of this study was to estimate genetic parameters and breed and crossbreeding effects on incidence of recorded clinical lameness (RCL) in New Zealand dairy cattle. Herd records from 76,357 cows distributed in 155 herds dedicated to the Livestock Improvement Corporation (LIC) sire-proving scheme during the 2005 to 2009 milking seasons were used to estimate the phenotypic, additive genetic, permanent environmental and residual variances of RCL in Holstein-Friesian (F), Jersey (J) and crossbred (FxJ) dairy cattle. RCL incident was coded "1" for cows that had at least one event of RCL at any day during lactation and a "0" code was used for cows without a RCL incidence. Genetic parameters and crossbreeding effects on RCL were estimated with a repeatability animal model, across breeds using restricted maximum likelihood methodology. The predicted mean incidence of RCL per herd was 7.74% with a range of 2% to 34%. Heritability estimate for the incidence of RCL for all lactations (1st to 10th lactation) was 0.016 ± 0.003 (\pm SE) and the repeatability was 0.071 ± 0.005 . The heritability estimate of RCL using only first lactation records was 0.05 ± 0.01 (\pm SE). Jersey cows had a lower mean (\pm SE) incidence of RCL than F cattle (J: $6.67 \pm 1.50\%$; JxF: $6.89 \pm 1.50\%$; F: $8.83 \pm 1.50\%$). The effect of first cross (F1) FxJ crossbred was $-1.2 \pm 0.3\%$ (\pm SE), representing a mean 16% reduction in RCL compared to an average of the parental pure breed J and F cattle. There was considerable variation (-5 to 8%) between sire estimated breeding values for RCL, suggesting that sire selection across breed and within breed could result in increased genetic resistance to RCL in New Zealand dairy cattle. A significant ($P < 0.05$) reduction in mean (\pm SD) milk solid yield per day was found in cows with RCL (1.40 ± 0.0012 kg) compared to cows without RCL (1.43 ± 0.0045 kg). Cattle in first lactation had a significantly higher incidence of RCL than cows in subsequent lactations ($7.6 \pm 0.1\%$, $4.6 \pm 0.1\%$, $5.2 \pm 0.1\%$, $6.3 \pm 0.1\%$ and $7.0 \pm 0.2\%$ (\pm SE) for first, second, third, fourth and fifth lactations, respectively). These results suggest that selection for resistance to lameness will result in a low rate of genetic gain but using Jersey sires can be an alternative to increase genetic resistance to lameness in New Zealand dairy cattle.

Keywords: Recorded clinical lameness, crossbreeding, genetic evaluation, dairy cattle.

ACKNOWLEDGEMENTS

I would like to acknowledge the Ministry of Foreign Affairs of New Zealand under NZAID agency for the scholarship that made possible the completion of this thesis. I offer my thanks to many people who made the completion of this thesis possible. Massive thanks to the following people who have contributed to the completion of my research work:

Associate Professor Nicolas Lopez-Villalobos, my main supervisor, thank you very much for your guidance, encouragement, patience, unconditional help and unlimited co-operation during the time of my study and research. You have made a significant contribution to my thesis as you have a long experience in animal breeding and genetics and you gave me constructive comments. Dr. Nicolas you had many ideas that have challenged me to develop and I have learnt a lot from you about genetics and breeding, and statistical analysis but above all human values.

Dr. Jean Margerison, my co-supervisor, thank you for taking time to read my draft of this thesis and for making valuable comments from a very clear mind. I am grateful for all your comments, suggestions and corrections. Your interest in ruminant lameness has led to follow up studies in my thesis and you have been a major source of information during our discussions.

Thanks to Livestock Improvement Corporation Ltd., New Zealand for providing me with the data set. I express my great gratitude to the Institute of Veterinary, Animal and Biomedical Sciences (IVABS) for creating an environment conducive to study. I would like to give thanks to NZAID and International Student Office staff: S. Hooker, O. Pimentel, K. Heagney, N. Banquette, R. Diane among others for your advice, kindness and support. Thanks to Massey staff for your constant support: Prof. Kevin Stafford, Wendy Graham, Debbie Hill and Kathy Hamilton.

Thanks to my fellow post-graduates and friends: Javier Baudracco, Jose Ramirez-Solis, Alfredo Lepori for their active co-operation in my early academic career. I would like to thank Peter Moono for being such a great

flatmate. I extend my thanks to Ps Dale Meacheam, Nick Ling for their spiritual guidance.

Thanks to the government of the United Republic of Tanzania through the Director of National Livestock Research Institute – Mpwapa for allowing me to pursue my studies.

Bertha my mother and the late Raphael Chawala, my father, for raising me in a good way, I appreciate your love and support. Thanks to my family back home for your love, care and encouragement during my studies. Tulalumba Kidava (Mtegeta), Pili Mahinda, Neema, Joseph, Debora, Yunesi, Anna, Grace, Bryson, Lucy, Andolelye, Tinno and Laban Msigwa.

Lastly, thanks go to everyone who in one way or another has contributed to this study.
