‘Only the Darkness Knows Who I Am’:
Discourses on x-rays in the shadow clinic and how visualizing shadows contributes to the possibilities of aesthetic empathy in the perception of the body in x-ray

A thesis presented in partial fulfilment of the requirements for the degree of

PhD
in
Visual and Material Culture

at Massey University, Wellington,
New Zealand.

Emily Clark

2012
Abstract

This thesis examines the discourses of x-ray images as they exist on-line. Throughout my research I apply both the stance of both the privileged flâneur/euse and the badaud(s) that have been identified as an ideological manifestation of the mass media since the early 20th century and established as characterisations of Euro-Western modernity (Shaya 2006). By examining specific case studies gathered from the resources of the World Wide Web, my thesis has worked to establish the existence of what I have called “The Shadow Clinic”. It applies methodologies that incorporate both subjective and objective viewpoints assigned to examine and provide analysis for, identifying an ‘empathic vision’ that might exist in the examination of clinical visual material. I have also investigated the possibilities of bringing to these images an empathic vision that incorporates both an aesthetic and semiotic analysis of the image along with an appraisal of the images’ effectiveness through narratives and responses. The basic premise is that images are powerful and demanding and the perspective of medical imaging technologies works like all other images to change our perception of ourselves as well as of our understanding of the world. Using the metaphorical, allegorical and physical entity of shadows as a visually potent, literally complex and politically charged manifestation, the methodological stance moves in between giving importance to the physical manifestation — or the quantifiable — and meta-physical — or qualitative.

Limited but unhindered by not being a radiologist, the authorial perspective is one of examination and analysis (rather than diagnostic) of images that have strongly impacted upon the visual world since the last century. Such images continue to produce concurrent social and cultural ambiguities — ambiguities that persistently exist between what is revealed and what is concealed.

Using the concept of “The Shadow Clinic”, this thesis demonstrates some of the plethora of discourses emergent through the visibility of x-ray imagery on–line and in addition to the more conservative approach of using medical material through the publication of academic papers and research, the space of the World
Wide Web is the space of the marketing, pedagogy, palliation and ministration. I have studied the workings of the Shadow Clinic, through the texts on the historical and political machinations of the Clinic by Foucault and Illich, as well as social and cultural theorist who concentrate on the place of empathic vision and clinical perspectives. This thesis particularly concentrates on the engagement with the aesthetic of empathy through visualization, and focuses on how shadows do the work of accentuating proximity and remoteness, the Body and embodiment.

Acknowledgments

This thesis has been made possible by the stalwart supervisory support of Dr. Patrick Laviolette and Dr. Bronwyn Labrum, to whom I am most grateful for their wisdom and patience, but I would also like to thank those who lent their support throughout what has been a gruelling four years. So thanks to my mother for her continued support; my late father for encouraging me to make connections; my siblings and their delightful offspring, for continuing to make me laugh; Professor Sally Morgan and the staff at Massey University in the Schools of Visual and Material Culture and at the College of Creative Arts. Outside the University I would also like to thank friends and colleagues, with a special mention to Harriet Burr, Robyn Shaw, Prof. Jeremy Diggle and Val Diggle, all of who have kept my feet on the ground when necessary.
INTRODUCTION

Reflections from the Shadow Clinic 1

PART ONE: THE SHADOW OF THE CLINIC

Chapter One

Kept in the Dark 34

Reaching for the Light 37

The Strength of the Shadow in Metaphor 48

The Clinical Body Shadow and the Screen 59

Chapter Two

Dark Adaptation at the Interface 70

The Body Spectacular 79

A Vision of Empathy 84

Private Bodies/Public Anxieties 92
## PART TWO: LIFE IN THE SHADOW CLINIC

### Chapter Three
- Spatial Shadows on the Internet  
- Heterotopias and Othering Spaces  
- Intersubjectivity / Interobjectivity in the Shadow Clinic

### Chapter Four
- Embodiment of the Posthuman Body  
- Desire for Dissemination with the Body Reborn  
- Appeal of Dark Subjects

### Chapter Five
- Iatrogenesis, the Good Death and its Palliation  
- Other Envisionings  
- Your Body - Your Shadow - Your Clinic?  
- Shady Projections

### CONCLUSION
- Traces of Exploitation

### BIBLIOGRAPHY

5.6 Re-purposed Heart
I am not ill; I am not seen as well; and I know I am not normal under the techno-clinical gaze. X-ray images have revealed all of this to me.

This thesis project starts with my will to address two things — things that were uncomfortable to talk about: discourses of normality and discourses of death. I, like many others, was not born ‘normal’. In 1966, approximately two years after the first open heart surgery had been accomplished successfully it was I who needed that surgery. I would like to thank the staff at St Thomas’ Hospital in London for successfully carrying out that operation, and later in 1973-4, the staff at Great Ormond Street Hospital for completing the job.

In hospital again from 1985-6 it was discovered that I had non-functioning female reproductive organs. I listened to the nurses talking at length about what they couldn’t see as they were examining images of my interior. It wasn’t non-functioning reproductive organs that they were looking at, but non-existent organs. Between x-rays and ultrasounds, the images of invisible organs were not getting any clearer to them.

I wondered, then, how much medical imaging technology was guiding the clinical profession to look for things that they might recognise, rather than what was in front of them. When faced with an unfamiliar large dark area, their first inclination was to blame the technology, lack of light, failing power etc. The attending nurses had not been informed about what to look for but to take all their information from the image. Before they could pass the image on to the examining specialist, they would have to provide an appropriately instructive result. What looked to the nurses like blank spaces did not carry the appropriate clinical information, or so they thought.

Their allegiance to technology and its outputs meant that I was just an extension of their task at hand. It is amazing how easy it is to spirit oneself away out of a situation where you are seemingly not needed. It was not to be for some years that I understood that something crucial was missing. It was the relationship between
the reader of the image and the person imaged, one that we might now call an empathic relationship.

Interestingly, through this imagery, they found what they were looking for suspected ovarian cancer…it did not seem to matter that they could not find any ovaries. That was twenty years ago and the ambition in medical imaging at the time was identifying ovarian cancer.

I would like to take the opportunity now to thank Dr. Deborah Keleman, now a child behavioural psychologist at Boston University, who, when we were just fourteen years old and at school together, listened to my suspicions that I had been born with a very singular body and believed me. Many, older and ‘wiser’, did not.

This thesis, will explore how imaging in the medical field is not just a question of discovery and identification of disorder, but rather one of artful viewing practices that are bound to the laws of aesthetics and perception thereby furthering a process of empathic viewing. A confidence in viewing practices, I will argue, has a lot to do with the levels of empathy afforded not only in the relationship between those that look and those that are looked upon, but also crucially in the looking. This is what might be termed an ‘empathic gaze’. Although it must be acknowledged that viewing practices in themselves have changed, as much as technologies have and are continuing to do so, I hope through this research to go some way to identifying some basic rules of envisioning which might contribute to the growing interest in medical imaging perceptions and their often peripheral contribution to medical relationships. The reader should be aware that the images that appear throughout this thesis might be considered disturbing. The author considered them so.
