— Abstract —

Population genetics and phylogenetics have the potential to provide enormous insights into the epidemiology and ecology of disease causing pathogens. Molecular datasets are the basis to infer population structure, gene flow (between host populations and between different geographical locations) and to predict the evolutionary dynamics of pathogens. *Campylobacter* colonisation in food producing animals has been extensively studied and the population structure and host association of *C. jejuni*, the most commonly reported gastro-enteric pathogen, has also been well defined. In contrast, host-pathogen relationships and the population structure of *C. jejuni* in urban wild birds and pets have not been well defined on a wide range of spatial and/or temporal scales. A greater understanding of these details should allow disease control authorities to track the transmission of pathogens from one host species to another, identify the origin of pathogens and to better understand environmental factors influencing underlying molecular mechanisms.

In the first study in this thesis the presence of *C. jejuni* in mallard ducks and starlings within five playgrounds in Palmerston North, New Zealand was studied. The prevalence of *Campylobacter* and *C. jejuni* in both species showed a bimodal seasonal pattern. The population structure and population differentiation of *C. jejuni* in these species were examined using multilocus sequence typing (MLST). Rarefaction analyses showed that the *C. jejuni* populations within mallard ducks were more diverse than starlings, particularly during the winter. Pairwise fixation indices showed that the population of *C. jejuni* in ducks was significantly different from that of starlings and that it differed over time. Conspicuous host association was evident with clonal complexes of *C. jejuni* such as ST-1034, ST-692 and ST-1332 specific to ducks and ST-177 and ST-682 specific to starlings. In addition, a larger proportion of *C. jejuni* genotypes that could not be assigned a clonal complex were found in both ducks and starlings, particularly during the winter.

In the second study, *C. jejuni* from domestic pets (dogs and cats) were characterised using MLST and by typing the cell surface antigens, *porA* and *flaA*. The ST-45 complex, a clonal complex predominantly reported in human campylobacteriosis cases, was found to be the predominant clone present in both species. These findings shed some light on the contribution of pets as a putative source of human campylobacteriosis cases in New Zealand.

In the third study, the ST-474 *C. jejuni* genotype, considered to be the endemic strain in New Zealand, was isolated from human cases and poultry carcasses from the Manawatu region from 2005 to 2009. Seven samples of ST-474 were sequenced and a subset of 50 full length genes were studied. These analyses demonstrated molecular differences between full length genes that were identical in the region used for MLST. Further, alleles characteristic of the ST-474 genome within the investigated metabolic housekeeping genes ($n = 25$) were identified. Our findings were that ST-474 genome is genetically distinct from other *C. jejuni* reference genomes with respect to certain alleles. In addition, MLST alleles were found to be robust predictors of the most recent common ancestors of a genome. The fourth study investigated the genetic stability and vulnerability of the informational genes to various evolutionary forces within the seven ST-474 genomes. Twenty five genes comprised of nucleotide metabolism, repair and ribosomal functions were investigated showing a high level of genetic diversity in the DNA repair as well as nucleotide metabolic genes such as *gidA*, *ogt*, *recJ*, *ssb*, *uvrA*, *uvrB* and *xseA*. In contrast, the ribosomal genes were stable and identical across the seven genomes. The insertion of selenocysteine in three of the 25 genes indicates the presence of horizontal gene transfer within the ST-474 genomes. It is hypothesised that the genetic uniqueness of ST-474 may have arisen due to the geographic isolation of New Zealand, its poultry industry and an absence of exchange of sequence types which might typically occur through international trade of fresh poultry meat.

Collectively, the studies presented in this thesis provide a better understanding of the dynamism of *C. jejuni* as a species and ST-474's adaptational capacity and evolutionary potential (within the investigated set of genes) in response to changing intracellular and extracellular environments. This thesis has introduced the idea of using individual full length gene analysis, demonstrating the molecular differences between genes that contained identical alleles at the MLST loci. The research approaches implemented in this thesis can be readily applied to any pathogenic bacteria, particularly foodborne and emerging pathogens such as *E. coli* and *Salmonella*. This, in turn should provide new opportunities for bacterial drug targets and vaccine candidates.

Acknowledgements

I sincerely thank my supervisors Professor Nigel French, Dr. Mark Stevenson and Dr. Jonathan Marshall for their valuable guidance without which this work would not have been possible. I thank my late supervisor Dr. Grant Hotter, who died suddenly during my second year of PhD, for his dedication, his enthusiasm and vision. I thank Dr. Deb Prattley, who came forward to help me during my difficult times and encouraging me and; Dr. Eve Pleydell for giving me moral support and encouragement. I owe my special thanks to Dr. Patrick Biggs, Massey Genome Service, IVABS, Massey University who had helped me learn certain valuable bioinformatics skills for my genome work and reading through my genome chapters.

I extend my sincere thanks to all of my laboratory colleagues from the mEpiLab and the staff from the Epicentre – Dr. Julie Collins, Dr. Anne Midwinter, Ms. Sarah Moore, Ms. Angie Reynolds, Mr. Errol Kwan, Ms. Rukshana Akther, Ms. Lynn, Ms. Rebecca Pattison, Mr. Simon Verschaffelt and all others for their timely help and suggestions. I thank Ms. Wendy Maharey and Mr. Neville Haack, for proof reading my chapters and references, respectively. I thank Dr. Eve Pleydell and Dr. Petra Mullner who gave me an opportunity to tutor in the MVM course that helped to cover some of my living expenses when my scholarship was finished.

I thank Vet. Nurse, Ms. Jill Hogan, for having been a great help to me during sample collection with a lot of patience and a friendly face. I thank my friends both past and present for their co-operation, help and fun they rendered me. I once again thank all the staff and students from the Epicentre, Massey University, for their support and help to run the journal club effectively and particularly, Ms. Christine Cunningham for being very caring and for giving me motherly affection.

I thank Dr. P. Ramadass (former HOD, Dept. of Animal Biotechnology, MVC, TANUVAS, India) who encouraged me to take up this PhD programme at the Massey University

and for visiting me during my candidature in New Zealand. I thank my best friend, Dr. T. V. Meenambigai, Associate Professor, Leptospira Diagnostic Laboratory, TANUVAS, India, for her constant valuable advises during my stay at India as well as New Zealand. I am much obliged to Dr. T. V. Meenambigai and Dr. Uma Arumugam (Associate Professor, TANUVAS) as well as all the ministerial staff members in the Registrar Office of Tamil Nadu University of Veterinary and Animal Science, Chennai, India, that helped me to get relieved from my duties to proceed with my higher studies.

I thank the New Zealand International Doctoral Scholarships (NZIDRS), funded by the New Zealand Government and Massey University for the Massey Doctoral Scholarship and the Massey Post-Graduate Research Fund that helped me procure lab consumables for my project. I thank Ms. Debbie Cresswell and Ms. Sally Iwakua who had been a great help in managing my scholarships and providing me prompt help and support.

I thank my parents for their continuous encouragement and blessings throughout my study period without which I would not have been able to overcome the difficult times during my candidature.

I am indebted to my family, my husband, Dr. Mohan Perumal and my children, Master. Honesh Vishva Bushan Mohan and Master. Vijayan Mohan for their co-operation, understanding and sacrifices during the tough times of my sampling and their patience during the entire period of my study.

Finally, I thank the supreme Lord of knowledge and wisdom, Lord Ganesha for removing my obstacles and giving me the strength to succeed.

Nomenclature

AFLP	Amplified fragment length polymorphism
AMOVA	Analysis of molecular variance
AT	Adenine – thymine
CBI	Codon usage bias index
CI	Confidence interval
CRISPR	Clustered regularly interspaced short palindromic repeats
DNA	De-oxyribonucleic acid
dN	Non-synonymous nucleotide substitution
dS	Synonymous nucleotide substitution
ESR	Environmental Science and Research Ltd
EU	European Union
FAO	Food and Agricultural Organization of the United Nations
GBS	Guillain-Barré syndrome
GC	Guanine – cytosine
GC3	Guanine – cytosine at the third codon position
HGT	Horizontal gene transfer
HL	Heat-labile (antigen)
HS	Heat-stable (antigen)
HK	Housekeeping
Ka	Non-synonymous nucleotide substitution

K_s	Synonymous nucleotide substitution
mCCDA	Modified cefoperazone charcoal desoxycholate agar
MLEE	Multilocus enzyme electrophoresis
MLSA	Multilocus sequence analysis
MLST	Multilocus sequence typing
MOMP	Major outer membrane protein
MST	Minimum spanning trees
NZ	New Zealand
NCBI	National Center for Biotechnology Information, USA
NZFSA	New Zealand Food Safety Authority
ORFs	Open reading frames
PCR	Polymerase chain reaction
<i>porA</i>	porin gene A
PFGE	Pulsed field gel electrophoresis
RAPD	Randomly amplified polymorphic DNA
rRNA	Ribosomal ribonucleic acid
RE	Restriction enzyme
REA	Restriction endonuclease analysis
RFLP	Restriction fragment polymorphism
spp.	Species (multiple)
ST	Sequence type
ST-U/A	Sequence type unassigned
SVR	Short variable region
TD	Tajima D
tRNA	Transfer ribonucleotide

6.3	Gene lengths of repair genes : Bold fonts refer to genes with different lengths	206
6.4	Ancestry shared between reference and ST-474 genomes based on GC and GC3 contents	212
6.5	CBI and scaled chi square similarities shared amongst ST-474 genomes within the repair and ribosomal genes that differ	214
6.6	Ancestry shared between the reference and ST-474 genomes according to codon usage:	215
6.7	Tajima's D values of the ribosomal, repair genes and nucleotide metabolic genes	216
6.8	Number of non-synonymous codons in the repair genes under purifying selection based on ω values	217
6.9	Average of mean relative evolutionary rates of non-synonymous codons of repair, ribosomal and nucleotide metabolic genes	218
6.10	Recombination sites identified within ribosomal and repair genes	219
6.11	MLST allelic profiles of reference genomes and <i>C. jejuni</i> ST-474 genomes	233
A.1	Faecal sample details of ducks and starlings for the isolation of <i>Campylobacter</i> spp.	A-3
A.2	Faecal sample details of ducks and starlings for the isolation of <i>Campylobacter</i> spp. continued	A-4
A.3	<i>flaA</i> and <i>porA</i> typing	A-6

A.4	Complete MLST profiles of <i>C. jejuni</i> from ducks and starlings	A-8
A.5	Complete MLST profiles of <i>C. jejuni</i> from ducks and starlings - continued	A-9
A.6	Partial MLST profiles of <i>C. jejuni</i> from ducks and starlings	A-10
A.7	Analysis of molecular variance (AMOVA)	A-12
A.8	Genetic differentiation of <i>C. jejuni</i> populations with respect to different sampling periods	A-13
A.9	Diversity indices of <i>C. jejuni</i> populations of ducks and starlings from dif- ferent sampling sites	A-14
C.1	BLAST table of <i>C. jejuni</i> ST-474 metabolic genes	C-2
C.2	Guanine-Cytosine (GC) content of seven MLST housekeeping genes of <i>C. jejuni</i> genomes	C-7
C.3	GC3 content of metabolic genes	C-8
C.4	Codon bias index (CBI) for twenty metabolic housekeeping genes . . .	C-10
C.5	Codon usage bias (Scaled chisquare) indices for metabolic housekeeping genes from reference and ST-474 genomes	C-11
C.6	Tajima D test values, synonymous and nonsynonymous sites of metabolic housekeeping genes	C-12
D.1	GC contents of selected subset of ribosomal and repair genes	D-2
D.2	GC3 contents of selected subset of ribosomal and repair genes	D-3
D.3	Codon usage bias indices of ribosomal and repair genes	D-4
D.4	Scaled chi square codon usage bias indices of ribosomal and repair genes	D-5
D.5	Polymorphic synonymous, nonsynonymous sites and the Tajima D values of the ribosomal and repair	D-6

‘The goal of mankind is knowledge ... knowledge is inherent in man. No knowledge comes from outside: it is all inside. What man ‘learns’ is really what he discovers by taking the cover off his own soul, which is a mine of infinite knowledge.’

Swami Vivekananda

A wise man is superior to any insults which can be put upon him, and the best reply to unseemly behavior is patience and moderation.

Moliere

Patience is the companion of wisdom.

Saint Augustine
