THE SYSTEMATIC DEVELOPMENT OF
A CONTROLLED FERMENTATION PROCESS
USING MIXED BACTERIAL STARTER CULTURES
FOR NHAM, A THAI SEMI-DRY SAUSAGE

A thesis presented in partial fulfilment of
the requirements for the degree of
Doctor of Philosophy in
Product Development in Food Fermentation
at Massey University

Pairote Wiriyacharee
1990
The aim of this thesis was to improve the quality of Nham, a traditional Thai fermented sausage, using systematic product development techniques. The traditional Nham fermentation depends upon a random bacterial flora. This study identified the starter cultures which could be used and developed an industrial production method using mixed starter cultures.

Systematic experimental designs were used to guide the development of the Nham fermentation; identification of the important processing factors using a Plackett and Burman experimental design, formulation and process development using full factorial designs in sequence of $2^4$, $2^3$ and $2^2$, and then a storage test of the product, testing of formulation and process in Thailand and finally a production trial of the new process in a factory in Thailand. Chemical, physical, microbiological, and sensory evaluation were used during the systematic product development. The study ended with consumer testing of the prototype product in the target market in Chiang Mai city and two villages - Ban Don Chai and Ban Ma-Kran.

The important factors affecting Nham quality were the mixed starter cultures and the carbon sources used in the Nham formulation. When the Nham base was inoculated with *Lactobacillus plantarum* $10^3$ cfu.g$^{-1}$, *Pediococcus cerevisiae* $10^6$ cfu.g$^{-1}$ and *Micrococcus varians* $10^3$ cfu.g$^{-1}$ acid production, firmness and colour development were optimum, the product was microbiologically safe and the sensory properties were acceptable to consumers. The addition of carbon sources increased acid development. 0.5% glucose and 6% cooked rice were optimum levels in the Nham formulation.

Temperature and relative humidity also affected the Nham fermentation. Temperature increased the rate of pH reduction, the firmness and colour development. High relative humidity decreased the weight loss. The Nham fermented at $30^\circ$C and 97% relative humidity had optimum acid production and sensory properties.

Nham is sold in Thailand between $20^\circ$C and $30^\circ$C, and at relative humidity as high as 97%. Experimental samples stored under similar conditions had a shelf life of 11 days and 9 days respectively. When the product was chilled at $10^\circ$C and $1^\circ$C, the shelf life was extended to 63 days and 103 days respectively. Enterobacteriaceae and *Staphylococcus aureus* counts fell during storage and no yeasts or moulds were observed. Off-flavour development controlled the shelf life.
Product profiles were determined for the Nham by Thai consumers and the ideal ratio method was used during the sensory product testing. A profile test using linear scaling with fixed ideal points was used for the trained sensory panels. The floating ideal point was used with consumer panels when the prototype product was close to ideal profile. Category scaling was used in the consumer testing of the final product. Sensory evaluation by one hundred and twelve families in Chiang Mai province indicated that appearance, texture, and flavour of Nham made with the mixed starter cultures were good.

The Nham successfully developed by using the systematic product development had a high quality in terms of consistency, microbiological safety and long shelf life and was also accepted by the target Thai consumers. The product could be produced in a simple plant with the existing equipment in fermented meat product factories in Thailand but there would need to be an increase in technology of culture preparation and controlled fermentation. The product could be sent from the cottage industry in the North to all provinces in Thailand, particularly to Bangkok, and also had a potential to be exported to overseas countries if chilled conditions were used.
ACKNOWLEDGEMENTS

This research study was financially supported by the New Zealand Bilateral Aid Programme administered by the Ministry of Foreign Affairs; I would like to take this opportunity of thanking this assistance.

I shall always be grateful to my chief supervisor, Dr Mary D. Earle; Director, Product Development Sub-Department, Massey University, for her constant inspiration, valuable guidance, patience and encouragement throughout this research, and also for giving me the opportunity of working on this topic.

To my co-supervisors; Dr J. D. Brooks, Food Technology Department, Massey University; Dr G. Page, Director, NZ Dairy Research Institute; and Mrs L. Rujanakraikarn, Food Science and Technology Department, Chiang Mai University; I wish to express my appreciation for their many useful suggestions and criticisms.

I would also like to express my appreciation to many people, both in New Zealand and Thailand, who assisted this research in many ways. In particular I would like to take this opportunity of thanking the following:

* Prof. R. L. Earle and the staff of the Faculty of Technology, Massey University for the use of facilities and for their support throughout.
* Prof. P. A. Munro and the staff of the Department of Food Technology and the Sub-Department of Product Development, Massey University especially Mrs Joan Brookes for providing facilities and willing assistance and encouragement.
* Prof. E. L. Richards and Dr I. Maddox for their advice on techniques of chemical analysis.
* Dr I. F. Boag, Production Technology Department, Massey University, for his valuable suggestion in the experimental design and analysis.
* Dr A. M. Anderson, Product Development Sub-Department, Massey University, for his valuable discussion.
* Dr Hugo Varela-Alvarez, Computer Centre, Massey University, for his useful suggestions in computer analysis and help in programming.
* Mr S. L. Oldfield and Dr B. H. P. Wilkinson for their valuable advice and comments on some parts of this research.
* Mrs J. Cleland for her willing assistance in preparation of microbiological materials and equipment.
* Mrs M. Bewley for her willing assistance in preparation of chemical materials and equipment.
* Asso. Prof. N. Na-Lumpang, Dean of Agriculture Faculty, Chiang Mai University for his permission to do some parts of this research in Thailand.
* The staff of Chiang Mai Livestock Breeding and Research Centre, Ministry of Agriculture and Cooperatives, Chiang Mai, for their help in the production trial.
* The Thai students at Massey University and Chiang Mai University who were members of the taste panels.
* The people in the King's Project, Chiang Mai, who participated in this research.
* The consumers in Chiang Mai city; Ban Don Chai, Yangkram district; Ban Ma-Kran, Shongkual district, who tested the final product.
* The staff of the Library and the Registry, Massey University for willing assistance in locating reference materials, and for advice on Ph.D. study programme, respectively.
* Mr Wichien Chatupote for his help in computer programming in particular chart programme.
* Miss V. J. Davis for her work in typing and correcting the thesis.

Finally, I would like to thank my mother and brother, also his family, for their support mentally during the course of my study.

LIST OF TABLES

1.1 General growth characteristics of food poisoning bacteria and moulds relevant to the processing of fermented meat
1.2 Staphylococcal enterotoxin development, dry sausage, 22-24°C
1.3 Botulinal toxin development, summer style sausage at 27°C
2.1 Basic formulation for Nham production
2.2 Definitions to describe the important characteristics of Nham
3.1 Plackett-Burman matrix for determining the effects of 10 variables at two level using 16 runs
3.2 The numbers of starter cultures in different media after incubation at 30°C
3.3 Nham formulation in Plackett-Burman experiment
3.4 The chemical and microbiological characteristics after 60 hours of Nham fermentation at 30°C and 43% relative humidity
3.5 The physical characteristics after 60 hours of Nham fermentation at 30°C and 43% relative humidity
3.6 The main effects and significance levels of starter cultures on the characteristics of Nham
3.7 The main effects and significance levels of curing agents on the characteristics of Nham
3.8 The main effects and significance levels of carbohydrate and seasonings on the characteristics of Nham
4.1 The full 2^4 factorial experiment with blocks, including four centrepoints for investigating the effects of mixed starter cultures on the characteristics of Nham
4.2 The mean ideal ratio scores of overall acceptability during 3-14 days of fermentation affected by starter cultures
4.3 Correlations of overall acceptability with the sensory attributes of Nham during 3-14 days fermentation
4.4 Fitted models for overall acceptability during 3-14 days of fermentation affected by starter cultures
4.5 Analysis of variance of overall acceptability during fermentation affected by starter cultures
4.6 Fitted models for pH during 3-14 days of fermentation affected by starter cultures
4.7 Fitted models for the gas production (G) during 2-6 days of fermentation affected by starter cultures
4.8 Fitted models for the compression force (CF) and compression energy (CE) during 3-10 days of fermentation affected by starter cultures

4.9 Fitted models for tristimulus values (X Y Z) and residual nitrite (RN) during 1-10 days of fermentation affected by starter cultures

4.10 Fitted models for weight loss (WL) during 7-14 days of fermentation affected by starter cultures

5.1 2^3 factorial design for investigating the effects of carbon sources and \textit{L. plantarum} on the pH reduction in Nham

5.2 Cooked rice, reducing sugars and pH at 18 hours of fermentation

5.3 The weight loss and compression force at 24 and 48 hours of fermentation

5.4 The tristimulus values (X Y Z) at 24 and 48 hours of fermentation

5.5 Fitted models for the reducing sugars (RS) during 6-24 hours of fermentation affected by carbon sources and \textit{L. plantarum}

5.6 Fitted models for the residual level of cooked rice (CR) during 12-48 hours of fermentation affected by carbon sources and \textit{L. plantarum}

5.7 Fitted models for the compression force (CF) during 24-48 hours of fermentation affected by carbon sources and \textit{L. plantarum}

5.8 Fitted models for the tristimulus values (X Y Z) during 24-48 hours of fermentation affected by carbon sources and \textit{L. plantarum}

5.9 The overall acceptability mean ideal ratio scores of Nham fermented for 3 and 7 days

6.1 The \textit{2^2} factorial design with centrepoints for investigating the effects of temperature and relative humidity on the rate of Nham fermentation

6.2 Fitted models for pH during 18-72 hours of fermentation affected by temperature

6.3 Calculation of the rate of pH reduction in Nham at different temperatures

6.4 Fitted models for weight loss (WL) during 72 hours of fermentation affected by temperature and relative humidity

6.5 Fitted models for the effect of temperature on the compression force (CF) during 72 hours of fermentation

6.6 Fitted models for the tristimulus values (X Y Z) at 48-72 hours of fermentation affected by temperature

6.7 The bacterial numbers in Nham fermented 1 and 3 days at different temperatures and relative humidities

6.8 The mean ideal ratio scores of most important attributes and overall acceptability of Nham fermented at different temperatures and relative humidities
6.9 Fitted models for the Nham characteristics (sensory evaluation) fermented at different temperatures for 3 days

6.10 Correlations between subjective and objective tests on Nham fermented at 3 days

6.11 The significant correlations between pH and compression force and tristimulus values of Nham fermented for up to 3 days

7.1 Prediction the shelf life of Nham (days) based on overall acceptability and off-flavour

8.1 Comparison of Nham produced in the laboratory (using fresh or frozen meat) in terms of pH, weight loss and bacterial counts

8.2 Comparison between experimental and commercial Nham (brand A and brand B). Ratios analysed using logarithms of ideal ratio scores

8.3 The mean ideal ratio scores of Nham fermented 2 days at 30°C, 97% RH for each attribute

8.4 Comparison of trained sensory panel and consumer panel using raw ideal ratio scores and logarithms of ideal ratio scores

8.5 Nham characteristics and acceptability in consumer product test

8.6 Acceptability of experimental Nham in consumer product test by location, sex, age group and career

8.7 Correlation of selected attributes of Nham with overall acceptability using the data from consumer product test

8.8 Mean ideal scores of Nham for the trained panel at Massey University, trained panel at Chiang Mai University and consumer panel in Thailand

8.9 Mean ideal scores of two commercial Nham (brand A and brand B) and experimental Nham (X) by trained panel in Chiang Mai

8.10 Comparison of the ideal ratios for the consumer panel and consumer test of selected attributes

8.11 Eating pattern for Nham

8.12 Major influences on buying decisions and retail outlets

8.13 Packaging preferences for Nham

8.14 Storage and keeping quality of Nham

8.15 Buying prediction for experimental Nham

9.1 Experimental designs, stages, and objectives during the formulation and process development

9.2 Types of sensory panels and evaluation techniques used in the project

9.3 Final formulation of Nham

5.2 Cooked rice, reducing sugars, and pH during the 1-2 days (I) and 2-7 days (II) of fermentation affected by the concentrations of cooked rice, glucose and \textit{L. plantarum} 88
5.3 Weight loss during 1-2 days (I) and 2-7 days (II) of fermentation affected by the concentrations of cooked rice, glucose and \textit{L. plantarum} 89
5.4 Compression force during 1-2 days (I) and 2-7 days (II) of fermentation affected by the concentrations of cooked rice, glucose and \textit{L. plantarum} 89
5.5 Tristimulus values (X Y Z) during 1-2 days (I) and 2-7 days (II) of fermentation affected by the concentrations of cooked rice, glucose and \textit{L. plantarum}

5.6 The chemical and physical changes during the first 48 hours and 2-7 days of fermentation affected by carbon sources and \textit{L. plantarum}

6.1 pH change during 72 hours fermentation at different temperatures and relative humidities

6.2 The rate of pH reduction during fermentation at 20\degree C, 25\degree C and 30\degree C

6.3 Weight loss during 72 hours fermentation at different temperatures and relative humidities

6.4 Compression force during 72 hours fermentation at different temperatures and relative humidities

6.5 The rate of firmness development during fermentation at 20\degree C, 25\degree C and 30\degree C

6.6 Tristimulus values (X Y Z) during 72 hours fermentation at different temperatures and relative humidities

6.7 The rate of colour development (x-value) during fermentation at 20\degree C, 25\degree C and 30\degree C

7.1 pH change during storage at different temperatures (1-30\degree C)

7.2 Weight loss during storage at different temperatures (1-30\degree C)

7.3 Compression force during the storage at different temperatures (1-30\degree C)

7.4 Tristimulus values (X Y Z) during storage at different temperatures (1-30\degree C)

7.5 Starter cultures (\textit{L. plantarum}, \textit{P. cerevisiae} and \textit{M. varians}) and mesophilic aerobic counts during storage at different temperatures (1-30\degree C)

7.6 Pathogenic bacteria (Enterobacteriaceae and \textit{S. aureus}) during storage at different temperatures (1-30\degree C)

7.7 (a) Sensory attributes (firmness, colour, sourness and off-flavour) during storage at different temperatures (1-30\degree C)

(b) Overall acceptability during storage at different temperatures (1-30\degree C)

7.8 The rate of pH change; weight loss; firmness; and colour deterioration during storage at different temperatures (1-30\degree C)

7.9 The rate of off-flavour; and overall acceptability changes during storage at 1-30\degree C

9.1 Systematic product development system and experimental designs used for improvement of Nham quality

9.2 Process chart of Nham production using mixed starter cultures

9.3 Effect of mixed starter cultures on Nham system
LIST OF APPENDICES

2.1 The calculation of compression and shear energy 202
2.2 The gas formation calculation 203
2.3 Standard curve of residual nitrite 204
2.4 Reducing sugars and cooked rice determination 205
2.5 Standard curve for reducing sugars as glucose 206
2.6 The important attributes of Nham identified by panelists 207
2.7 Formulation of Nham for first trained panel to identify and discuss Nham characteristics 208
2.8 The questionnaire and definitions used to train the panelists in Thailand 209
4.1 Trained panel for Nham testing, Nham characteristics 211
4.2 Results for $2^4$ factorial design used for multiple regression 212
4.3 Regression equation and regression statistics from the $2^4$ factorial design and an example of the method used to test for goodness of fit 225
4.4 The multiple regression equations for dependent variables affected by starter cultures 226
4.5 Analysis of variance of overall acceptability during Nham fermentation 236
5.1 Results for $2^3$ factorial design used for multiple regression 238
5.2 The multiple regression equations for dependent variables affected by carbon sources and \textit{L. plantarum} 243
6.1 Results of $2^2$ factorial design for multiple regression 246
6.2 The multiple regression equations for dependent variables affected by temperature and relative humidity 248
6.3 Calculations of the rate of firmness and colour development in Nham incubated at different temperatures 250
7.1 The storage test questionnaire 251
7.2 The results of dependent variables during the storage of Nham at different temperatures (1-30°C) 252
7.3 The rate of pH, weight loss, firmness, colour, off-flavour, and overall acceptability changes during storage of Nham at different temperatures (1-30°C) 257
7.4 Calculation of the shelf life of Nham at different temperatures (1-30°C) 259
8.1 Product testing questionnaire (translated into Thai) 260
8.2 Questionnaire for housewives (translated into Thai) 262
8.3 (a) Product testing questionnaire (translated into English) 265
   (b) Questionnaire for housewives (translated into English) 267
8.4 The overall acceptability of developed Nham 269
8.5 (a) Eating pattern for Nham 271
