ENERGY METABOLISM, RANGING BEHAVIOUR

AND

HAEMATOLOGICAL STUDIES

WITH

ROMNEY MARSH AND CHEVIOT SHEEP

being a thesis
presented for the Degree
of Doctor of Philosophy in the
University of New Zealand

Eric Cresswell
Massey Agricultural College
University of New Zealand

1958
ACKNOWLEDGEMENTS

This work was carried out during the tenure of a Senior Research Fellowship of the Research Committee of the University of New Zealand. Financial assistance was also supplied by Massey Agricultural College.

Grateful recognition is made of the generosity of the Nuffield Foundation and Cooper McDougal and Robertson Ltd., England.

It is desired to extend particular thanks for all advice, support, assistance and facilities to the following:-

Professor G.S. Peren, C.B.E., Professor A.L. Rae, Mr. M.W. Webster, Dr. C.R. Barnicoat, Miss M.G. Campbell and the Library staff, Mr. C.H. Fairless and Mr. T. Crotty, all of Massey Agricultural College.

Grateful acknowledgement is made of the generosity of the Medical Superintendent, Dr. J.H. North; the Pathologist, Dr. T.H. Pullar; the Principal Bacteriologist, Mr. H.E. Hutchings and the Instrument Maker, Mr. G.D. Kemp of the Palmerston North Public Hospital.

The counsel of Professor R.W. Dougherty of the University of Cornell, U.S.A. and Dr. A.T. Phillipson of the Rowett Research Institute, Scotland was a source of great encouragement.

The typing labours of Mrs. A.W. Warren, Massey Agricultural College, and Miss S. Allen and Mrs. G. Montrose of Utah State University are no less appreciated.

LIST OF ILLUSTRATIONS

Figure I. The shoulder profiles of 10 South Country (Border) Cheviot and 10 North Country Cheviot ewes at Sourhope hill research station, Scotland (Wannop 1956).

Figure II. Total 24-hour basal heat production referred to body weight - sheep. The solid dots represent a U. S. A. cross between the Southdown and Rambouillet and the hollow circles Australian Merinos (Benedict 1938b).

Figure III. Showing (1) weather data, (2) average distances traveled in miles per week for Cheviot and Romney Marsh ewes, (3) periods and locations, (4) dates of recording periods.

Plate 1. Typical Border Cheviot ewe.
2. Typical Romney Marsh ewe.
3. Cheviot Hills 20/6/46.
4. Romney Marsh 31/7/54.
5. Cheviot Hills 16/10/45.
7. 'Field' pattern tracheotomy tube (a), with introducer (b) and rubber balloon (c).
8. X-ray plate showing inflated balloon occluding the upper trachea of a sheep.
9. Sheep before the insertion of a tracheal balloon, (a).
10. Sheep after the insertion and inflation of a tracheal balloon. Note - pilot balloon (a) connection tube (b).
Plate 11. Tracheal cannula with corrugated rubber cuff (a).

12. A spirometer recording in progress using the modified 'Field' pattern tracheal cannula. (a) External sealing pads, (b) Spirometer, (c) Two way valve corresponding to the animal's nostrils.

13. Modified 'Field' pattern tracheotomy tube with tracheal supports (a) and (b).

14. Modified 'Field' pattern tracheotomy tube with rubber sheath (a) and introducer cones (b) and (c).

15. Connection tube for linking sheep to oxygen spirometer.

16. "T" cannula open--showing (a) Grooved edge, (b) Capillary tube, (c) Roll-on rubber cuff, (d) Rubber extension tube, (c) Pilot balloon, (f) Cutting edge to fit groove (a), and Chamfered tube (g).

17. "T" cannula closed.

18. A spirometer recording in progress using the "T" cannula. Note the lack of external sealing pads on the sheep's neck.

19. Interior of sheep shed.

20. Typical oxygen spirometer graph. Note the downward blips "X" produced during eructation. These blips are due to cessation of breathing and not to the entry of eructated gas into the spirometer.

21. Metabolism charts illustrating:- 1. The lack of effect of prolonged metabolism recordings on the respiratory pattern and rate of oxygen consumption. 2. The repeatability of recordings: chart B was made 8 minutes after chart A. 3. Eructation blips "X".

Plate 23. The energy metabolism experiment sheep 7/5/57 (prior to slaughter on 8/5/57).

24. The respiratory pattern of a sheep before and after shearing

25. The respiratory pattern of a shorn sheep before and after wetting.

26. The respiratory pattern of an unshorn sheep before and after wetting.

27. Oxygen spirometer graphs made with an eight minute gap between recordings using the same sheep.

29. The respiratory pattern of a ruminating sheep. The points of regurgitation are marked by the large upward blips "X".

30. Showing details of the design and construction of the Rangemeter.

31. Showing details of the design and construction of the Rangemeter.

32. Showing details of the design and construction of the Rangemeter.

33. Showing details of the design and construction of the Rangemeter.

34. A view of the holding paddock, Tua Paka, taken from the central ridge.

35. Rangemeter flock sheep mustered for mileage recordings to be noted.

36. Front and rear views of sheep in Rangemeter harness.

37. Romney Marsh ewe nursing lamb while in harness.
Plate 38. Rangemeter flock ewes on their way out to the hill after mustering.

39. Rangemeter flock ewes on the hill.

40. Reading the Rangemeters.

41. Measuring the height at withers.

42. Blood dye injection. Note the shaven neck.
LIST OF TABLES

Table 1. G. B. Meteorological Office weather data (average figures) for the recording stations nearest to Romney Marsh and the Cheviot Hills. 19

2. Chronological events--energy metabolism sheep--19/9/56 to 8/8/57. 70

4. Showing (1) The breed means and St. D's per experiment for oxygen consumption in litres per five minutes. (2) The F. values derived from between breed analyses of variance (Appendix A, tables 8, 9, 10, 11) carried out on the oxygen consumption data related to the following bases: (a) Animal, (b) Kg. body weight, (c) Sq. metres surface areas (computed), (d) Kg. body weight to the power 0.73. (3) Significance of difference between breeds. (4) Mean body weights for periods in kilograms. 86

5. Showing (1) The lamb production data of ewes 1-10 in the energy metabolism experiments. (2) The analysis of variance between breeds for lamb rate of gain. 88

6. The standard deviations of the breed means for O2 consumption within blocks expressed as percentages of the means (to nearest %). 90

7. Showing--figures in the literature and those calculated from the data in this project for the Calories/24 hours heat production of sheep. 98

8. Carcass and organ data, energy metabolism experiment ewes. 99

9. Haematological data of energy metabolism experiment ewes 7/5/57. 100
Table 10. Showing the oxygen consumption records (litres $O_2/5$ minutes) of eleven sheep; (1) Pre and post shearing, (2) Pre and post wetting after shearing, (3) Routine recordings with an eight minute time interval, (4) One final routine recording.

11. The oxygen consumption records in litres consumed/ five minutes of three sheep each fed 1 lb. oats after twelve hours starvation and again eight hours later.

12. The effect of thyroxine treatment on the oxygen consumption, respiration rate and liveweight of one Romney Marsh ewe.

13. The results of analyses of gas samples drawn after the sheep had exhausted half the reservoir capacity of a closed circuit oxygen spirometer.

14. The daily distances walked by different sheep breeds singly and in various combinations (Louw et al. 1948).

15. The total distance (in yards) traveled by each sheep during twenty four hour periods (England 1954).

16. Percentage time spent resting in the hours 7:00 a.m. - 7:00 p.m. by lowland and hill sheep, April - September (Hunter 1954).

17. The average daily distance walked by four sheep breeds (Van Rensburg 1956).

18. Rangemeter sheep weights 24/8/57/

20. (1) Average $\&$ greater weekly mileage traveled by Cheviot over Romney sheep, within periods. (2) Significance of difference in weekly mileages between breeds within periods using week means. (3) Significance of difference between weeks within periods within breeds.
Table 21. Levels of significance of difference in weekly mileages between consecutive periods within breeds using sheep means.

22. Comparison of foreleg measurements, Haematology and Rangemeter sheep.

23. Comparison of height at withers measurements (unshorn sheep) von Borstel (1951) and Haematology flock this project.

24. The distribution of high potassium values in the red blood cells of British breeds of sheep (Evans and Mounib 1957).

25. Summarising data in the literature on haematological values for sheep.

26. Summarising data in the literature on blood volumes of sheep (Hansard et al. - 1953).

27. The general production data of the Haematology flock.

28. Haematological data of the Haematology flock and the results of analyses of variance carried out on the same data.

30. The mean concentrations of Potassium in the whole blood and red blood cells, Haematology flock 3/10/56, also data ex Evans (1954).
