ABSTRACT

Three pre-sowing hydration-dehydration treatments were evaluated for their capacity to protect or repair wheat seeds stored under two different sets of artificial ageing conditions (accelerated ageing at 100% RH, 40°C or controlled deterioration at 15% SMC, 35°C). Although similar losses in germination capacity and decreases in radicle emergence rates occurred under both ageing conditions, differences with respect to the physiology of ageing were highlighted by changes in seedling growth and seed leakage. For example, increases in seed leakage observed during storage at 15% SMC were not found at 100% RH.

Longer hydration treatments (either 24 h at 15°C in water or 20 h at 20°C in -0.37 MPa PEG solution, followed by drying) improved the vigour of unaged seeds, but treated material deteriorated rapidly in storage compared to untreated controls. In contrast short hydration treatments (2 h at 25°C followed by drying) offered some protection of germinability during subsequent storage but did not affect the vigour of unaged seeds. When seeds were treated after storage, longer hydration periods were effective in producing substantial invigoration of viable deteriorated seeds (measured by evaluating T50 or seedling growth) compared to little or no improvement by short hydration treatments. These results support earlier suggestions from work on tomato seeds that losses in seed vigour and viability are not necessarily a continuum of the same deteriorative sequence.

The mechanisms of protection of germinability by short hydration treatments were not clear. Small decreases in T50's of unaged or aged seeds as a result of these treatments were due to leakage of germination inhibitory substances. However, the rapid germination of unaged and improved responses from aged seeds caused by longer hydration treatments suggested advances in germination processes and repair activity under these conditions. This aspect was pursued in further detail by studying changes in the hydrolytic metabolism of wheat seeds using the 20 h PEG treatment.
Although the starchy endosperm of treated seeds showed some indications of protein degradation, there were no changes in proteolytic activity (determined as 'Azocoll' hydrolysing activity at pH 6.8) as a result of ageing or pre-sowing treatment after storage. However, there were some indications of loss of control over proteolytic activity in seeds subjected to treatment before storage. Severe damage to membrane permeability in these seeds appears to be a post-mortem event as this was only found in samples showing drastic losses in seed germinability.

Pre-sowing treatment caused a buildup of germinative α-amylase activity in unaged but not in aged seeds, although both showed similar radicle emergence rates. Quick resumption of α-amylase production during subsequent imbibition by treated seeds, irrespective of ageing, suggests that components involved in de novo enzyme synthesis are tolerant to desiccation in wheat seeds. Increased α-amylase activity in treated seeds or its maintenance during subsequent storage, surprisingly did not cause damage to stored starch. There was no relationship between increased α-amylase activity and early radicle emergence.

The ageing-induced delay in germinative α-amylase production appeared to be due to delayed gibberellin synthesis by the aged embryo. Pre-sowing treatment of seeds after storage effectively decreased the lag period for enzyme production in deteriorated seeds. Ageing effects on aleurone were characterised by investigating changes in the responsiveness of embryoless half seeds to gibberellic acid with respect to α-amylase production in vitro. Ageing of seeds caused a significant reduction in aleurone enzyme production. These changes were at least in part, reversed by pre-sowing treatment of aged seeds.

Abbreviations: h = hours; PEG = polyethylene glycol; RH = relative humidity; SMC = seed moisture content; T50 = time to 50% radicle emergence.
ACKNOWLEDGEMENTS

I wish to express my deep sense of gratitude to Dr Peter Coolbear for his excellent supervision, critical discussion and constant encouragement throughout this work. I am also highly indebted to Dr John Hampton for his suggestions and critical reading of the manuscript. My heartfelt gratitude is also extended to Dr Clive Cornford (Botany and Zoology Department) for his excellent supervision and facilities provided during the enzyme studies and for his critical reading of the manuscript.

The valuable assistance provided by several others during the course of this work is gratefully acknowledged and in particular, I wish to thank the following:

- Mr Craig McGill for technical assistance in Electrophoresis work and a friendly support throughout this study.

- Dr D.W. Fountain for suggestions on assaying protease activity in seeds.

- Dr K. Sutton (Wheat Research Institute, Christchurch) for HPLC analysis of proteins.

- Mr D. Hopcroft (DSIR, Fruit and Trees) for Electron microscopic work.

- Mrs Anne Davies for her excellent typing of the thesis.

- Mr G. Donaldson for computer aided graphic work.

- Mrs Dulcie Humphrey, Mrs Karen Johnstone, Mrs DEM Meech, Mr Ray Johnstone and Mr Robert Southward for their help in so many ways.

This PhD programme was sponsored by 'The Rotary Foundation of Rotary International', Illinois, U.S.A., under the 'Freedom from Hunger' scholarship programme. I wish to express my gratitude to 'The Rotary International', the sponsoring Rotary Club of Mandya (district 319, India) and to the host Rotary Club of Palmerston North (district 994, New Zealand) for making
this study possible. My deep sense of gratitude is also extended to Rotarian Ross Grigor and Mrs Joan Grigor who warmly involved us in the New Zealand way of life; without their counsel and support in so many ways, this work could not have been completed.

I gratefully acknowledge the encouragement and support of Prof. Murray Hill, Director, Seed Technology Centre which played a vital role in completion of this work.

I am also indebted to 'The Miss EL Hellaby Indigenous Grasslands Research Trust' and the 'Helen E. Akers' Scholarship for financial assistance provided in the later stages of this work. In this regard, the recommendations of Prof. Murray Hill and Prof. J. Hodgson are very much appreciated.

Finally, I am pleased to thank my parents and acknowledge the patient support and love of my wife Sandhya and children Ramya and Kartik.

With great pleasure I dedicate this work to one of the primary ideals of 'The Rotary International' - 'Community Service'.

3.6.2 Soluble Sugars in Seeds and Seed Leachate 70
3.6.3 Studies on Leakage of Germination Inhibiting Metabolites from Seeds 71
3.7 ELECTRON MICROSCOPY 71
3.8 STUDIES ON PROTEOLYTIC ACTIVITY 71
3.8.1 SDS-Polyacrylamide Gel Electrophoresis of Total Seed Proteins 72
3.8.2 High Performance Liquid Chromatography 73
3.8.3 Protease Activity 73
3.8.3.1 Choice of assay conditions 73
3.8.3.2 'Azocoll' hydrolysing activity of seeds

3.9 α-AMYLASE ACTIVITY

3.9.1 Determination of Enzyme Activity in Seeds

3.9.1.1 Enzyme extraction efficiency

3.9.1.2 Inhibition of α-amylase activity by possible co-extraction of inhibitors

3.9.2 Localization of Enzyme Activity in Seeds

3.9.2.1 Substrate-film technique

3.9.2.2 Quantification of enzyme activity in different parts of the grain

3.9.3 Studies on Aleurone Responses to Exogenously Applied GA3

CHAPTER 4 EVALUATION OF SHORT SOAKING TREATMENTS FOR IMPROVING THE GERMINATION PERFORMANCE OF AGED WHEAT SEEDS

4.1 INTRODUCTION

4.2 RESULTS

4.2.1 Responses of the Three Wheat Seed Lots to Accelerated Ageing Conditions

4.2.2 The Effect of 2 or 12 h Soaking Treatments at 35°C on the Germination Performance and Electrical Conductivity of Unaged and Aged Karamu 1987 Wheat Seeds

4.2.3 The Effect of 2 or 12 h Soaking Treatments at 35°C on the Germination Performance and Electrical Conductivity of Unaged and Aged 'Oroua' Seed Lots

4.2.4 Effect of Reducing the Soaking Temperature on the Efficiency of Invigoration by 2 h Soaking Treatment of Karamu 1987

4.2.5 Effect of Washing Seeds in Water and/or Germinating Over a Seed Leachate Media on the Germination Performance of Four Wheat Cultivars
### DISCUSSION

#### 4.3.1 Responses of the Three Seed Lots to Accelerated Ageing Conditions

#### 4.3.2 Responses of Seeds to Short Soaking Treatments

#### 4.3.3 Evaluation of the Suggestion of Physiological Repair (Goldsworthy et al., 1982) During Short Soaking Treatments

### CHAPTER 5 EVALUATION OF DIFFERENT PRE-SOWING HYDRATION TREATMENTS FOR THE PROTECTION OR REPAIR OF STORED WHEAT SEEDS cv. KARAMU

#### 5.1 INTRODUCTION

#### 5.2 RESULTS

##### 5.2.1 The Effects of Accelerated Ageing or Controlled Deterioration on Karamu 1988 Wheat Seeds

##### 5.2.2 The Effects of Different Pre-sowing Hydration Treatments on Unaged Karamu 1988 Wheat Seeds and Interactions with Ageing

##### 5.2.2.1 Effect on unaged seeds

##### 5.2.2.2 The effects of pre-sowing hydration treatments applied to seeds before exposure to ageing conditions

##### 5.2.2.3 The effects of pre-sowing hydration treatments applied to seeds after exposure to ageing conditions

#### 5.3 DISCUSSION

##### 5.3.1 Responses of Wheat Seeds cv. Karamu, to Different Storage Regimes

##### 5.3.2 Effect of Different Hydration Treatments on Unaged and Deteriorated Seeds, cv. Karamu

##### 5.3.3 Responses of Wheat Seeds, cv. Karamu, to Hydration Treatments given as Protection before Storage
CHAPTER 6  CHANGES IN SEED PROTEINS AND PROTEOLYTIC ACTIVITY DURING AGEING OR PRE-SOWING TREATMENT OF WHEAT SEEDS

6.1 INTRODUCTION  133
6.2 RESULTS  135
6.2.1 Scanning Electron Microscope Studies of the Starchy Endosperm  135
6.2.2 Studies on Qualitative Changes in Seed proteins Using SDS-Polyacrylamide gel Electrophoresis  135
6.2.3 Studies on Quantitative Changes in Seed Proteins Using High Performance Liquid Chromatography  141
6.2.4 Changes in the Azocoll Hydrolysing Activity of Seeds in Response to Ageing or Pre-sowing Treatment of Seeds  144
6.3 DISCUSSION  144
6.3.1 Changes in Protease Activity (Azocoll Substrate) and Seed Proteins During Ageing of Wheat Seeds  144
6.3.2 Changes in Seed Proteins and Protease Activity (Azocoll Substrate) Due to Pre-sowing Treatment of Unaged and Aged Seeds  144
6.3.3 Effects on Seed Proteins and Protease Activity Due to Treatment of Seeds Prior to Storage  146

CHAPTER 7  THE EFFECTS OF AGEING AND PRE-SOWING TREATMENT ON THE $\alpha$-AMYLASE ACTIVITY OF WHEAT SEEDS

7.1 INTRODUCTION  148
7.2 RESULTS  150
7.2.1 The Effect of Pre-sowing Treatment on the $\alpha$-amylase Activity of Unaged Wheat Seeds  150
7.2.1.1 Changes in $\alpha$-amylase activity in response to pre-sowing treatment  150
7.2.1.2 Localization of α-amylase activity in untreated and treated seeds

7.2.2 The Effect of Ageing and pre-sowing Treatment on α-amylase Activity

7.2.2.1 Pre-sowing treatment induced changes in α-amylase activity of slow aged seeds (treatment after ageing)

7.2.2.2 Changes in α-amylase activity due to pre-sowing treatment of rapidly aged seeds (treatment after ageing)

7.2.2.3 Changes in the α-amylase activity during storage of treated seeds (treatment before ageing)

7.2.3 The Effect of Ageing or Treatment Related Changes in α-amylase Activity of Seeds on Stored Starch

7.2.3.1 Electron microscopic study of the starchy endosperm

7.2.3.2 Changes in soluble sugar levels in seed or seed leachate

7.2.4 The Effect of Ageing and Pre-sowing Treatment on the Responses of Aleurone Tissue (endosperm halves) to Exogenous Application of Gibberellic Acid

7.2.4.1 The effect of ageing

7.2.4.2 The effect of pre-sowing treatment on the aleurone tissue of unaged or slow aged seeds

7.2.4.3 Responses of aleurone tissue from aged or treated seeds to changes in GA₃ concentration

7.3 DISCUSSION

7.3.1 Effects of Ageing and Pre-sowing Treatment on the α-amylase Activity of Wheat Seeds

7.3.1.1 Effect of ageing on base levels of activity

7.3.1.2 Effect of pre-sowing treatment on the α-amylase activity of unaged and aged seeds

7.3.1.3 Age-induced reduction of aleurone tissue sensitivity to GA₃ and the effects of pre-sowing treatment
7.3.2 The Relationship Between Changes in α-amylase Activity and Germination Performance of Wheat Seeds 187

7.3.3 Effects of Ageing or Treatment Related Changes in α-amylase Activity on Stored Starch 187

7.3.4 Possible Mechanisms of Changes in α-amylase Metabolism During Ageing or Pre-sowing Treatment 189

CHAPTER 8 GENERAL DISCUSSION 192

8.1 EVALUATION OF KEY FINDINGS AND LIMITATIONS OF THIS STUDY 192

8.1.1 Pre-sowing Treatments for Protection or Invigoration of Wheat Seeds 192

8.1.2 Relationship Between α-amylase or Protease Activity and Germination Performance in Wheat Seeds 194

8.1.2.1 Relationship between α-amylase activity and germination performance 194

8.1.2.2 Relationship between protease activity and germination performance 197

8.1.2.3 Comparison of the effects of PEG treatment with those of sprouting damage 197

8.1.3 Effects of High vs Lower Moisture Ageing in Wheat Seeds 198

# ABBREVIATIONS

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Full Form</th>
</tr>
</thead>
<tbody>
<tr>
<td>AA</td>
<td>accelerated ageing</td>
</tr>
<tr>
<td>ABA</td>
<td>abscisic acid</td>
</tr>
<tr>
<td>ATP</td>
<td>adenosine triphosphate</td>
</tr>
<tr>
<td>CD</td>
<td>controlled deterioration</td>
</tr>
<tr>
<td>cv</td>
<td>cultivar</td>
</tr>
<tr>
<td>d</td>
<td>days</td>
</tr>
<tr>
<td>DNA</td>
<td>deoxyribonucleic acid</td>
</tr>
<tr>
<td>dwt</td>
<td>dry weight</td>
</tr>
<tr>
<td>EC</td>
<td>electrical conductivity</td>
</tr>
<tr>
<td>EDTA</td>
<td>ethylenediaminetetraacetic acid</td>
</tr>
<tr>
<td>Fig</td>
<td>figure</td>
</tr>
<tr>
<td>g</td>
<td>gram</td>
</tr>
<tr>
<td>GA</td>
<td>gibberellic acid</td>
</tr>
<tr>
<td>GADA</td>
<td>glutamic acid decarboxylase activity</td>
</tr>
<tr>
<td>h</td>
<td>hours</td>
</tr>
<tr>
<td>HMW</td>
<td>high molecular weight</td>
</tr>
<tr>
<td>HPLC</td>
<td>high-performance liquid chromatography</td>
</tr>
<tr>
<td>ISTA</td>
<td>International Seed Testing Association</td>
</tr>
<tr>
<td>IUPAC-IUB</td>
<td>International union of pure and applied chemistry and the International union of biochemistry</td>
</tr>
<tr>
<td>kD</td>
<td>kilo Dalton</td>
</tr>
<tr>
<td>LSD</td>
<td>least significant difference</td>
</tr>
<tr>
<td>M</td>
<td>molar</td>
</tr>
<tr>
<td>ME</td>
<td>moisture equilibration</td>
</tr>
<tr>
<td>mg</td>
<td>milligram</td>
</tr>
<tr>
<td>mM</td>
<td>millimolar</td>
</tr>
<tr>
<td>MPa</td>
<td>megapascal</td>
</tr>
<tr>
<td>mRNA</td>
<td>messenger RNA</td>
</tr>
<tr>
<td>mwt</td>
<td>molecular weight</td>
</tr>
<tr>
<td>nm</td>
<td>nanometer</td>
</tr>
<tr>
<td>OD</td>
<td>optical density</td>
</tr>
<tr>
<td>p</td>
<td>probability of non occurrence of the event</td>
</tr>
<tr>
<td>PEG</td>
<td>polyethylene glycol</td>
</tr>
<tr>
<td>Abbreviation</td>
<td>Definition</td>
</tr>
<tr>
<td>--------------</td>
<td>------------</td>
</tr>
<tr>
<td>PGR</td>
<td>plant growth regulator</td>
</tr>
<tr>
<td>Poly(A)$^+$ RNA</td>
<td>polyadenylated RNA</td>
</tr>
<tr>
<td>PST</td>
<td>pre-sowing treatment</td>
</tr>
<tr>
<td>RH</td>
<td>relative humidity</td>
</tr>
<tr>
<td>RNA</td>
<td>ribonucleic acid</td>
</tr>
<tr>
<td>SDS-PAGE</td>
<td>sodium dodecyl sulphate-polyacrylamide gel electrophoresis</td>
</tr>
<tr>
<td>Sec</td>
<td>section</td>
</tr>
<tr>
<td>SH</td>
<td>sulfhydryl</td>
</tr>
<tr>
<td>SMC</td>
<td>seed moisture content</td>
</tr>
<tr>
<td>SE/SEM</td>
<td>standard error of mean</td>
</tr>
<tr>
<td>T50</td>
<td>time to 50% radicle emergence</td>
</tr>
<tr>
<td>tab</td>
<td>table</td>
</tr>
<tr>
<td>v/v</td>
<td>volume/volume</td>
</tr>
<tr>
<td>w/v</td>
<td>weight/volume</td>
</tr>
<tr>
<td>μS</td>
<td>microsiemen</td>
</tr>
<tr>
<td>α</td>
<td>alpha</td>
</tr>
<tr>
<td>β</td>
<td>beta</td>
</tr>
<tr>
<td>~</td>
<td>approximately equal to</td>
</tr>
<tr>
<td>&lt;</td>
<td>less than</td>
</tr>
<tr>
<td>&gt;</td>
<td>greater than</td>
</tr>
</tbody>
</table>
