STUDIES OF CASTRATION AND TAILING IN YOUNG LAMBS; INFLUENCES OF DIFFERENT METHODS ON ACUTE DISTRESS RESPONSES.

A thesis in partial fulfilment of the requirements for the Degree of

MASTER OF SCIENCE

in
Physiology
at
Massey University.

STEPHEN JOHN LESTER
1991
ABSTRACT

An investigation of the acute effects of several methods (rubber rings, knife and docking iron) of castrating and tailing 4 to 5 week old lambs was performed. The investigation consisted of a study of certain anatomical aspects of the sites of castration and tailing, experimental validation of the behavioural responses as indices of distress, ranking of the various methods of castration and tailing according to the acute responses and testing of the effects of handling on lambs castrated plus tailed with the knife.

The innervation of the external genitalia and the tail was described and the pattern of innervation was discussed with respect to castration and tailing.

The behaviour elicited by castration and tailing was dependent upon the method used. Following rubber ring application the behaviours exhibited were increased activity, increased recumbency of which a high proportion was lateral, and these behaviours were associated with elevated plasma cortisol concentrations and are therefore suggested to be indicative of distress.

After use of the knife or the docking iron abnormal standing/walking behaviour was associated with elevated plasma cortisol concentrations and therefore appeared to indicate distress. The behavioural and plasma cortisol responses continued beyond the 4 hour observational period of the first experiment so a second experiment was performed. It demonstrated that the response to castration plus tailing with the knife approached completion at 8 hours. Handling of lambs to effect blood sampling did not appear to significantly affect the response.

Ranking of the methods of castration plus tailing, castration only and tailing only showed that the use of the knife was apparently more distressing than any other procedure. Apparently less distressing than the use of the knife but similar to each other were castration plus tailing with the rings, castration only with the ring, short-scrotum plus tailing with the rings and castration with the ring plus tailing with the docking iron. Tailing only with the ring and tailing only with the docking iron were apparently as distressing as handling with jugular venipuncture, although it is
suggested that the quality of the distress apparently experienced would have been different.

Thus in order to minimise the acute effects on lambs, there is evidence that the best methods are as follows.

1. For castration plus tailing: castration plus tailing with the rubber rings, short-scrotum plus tailing with the rubber rings or castration with the rubber ring plus tailing with the docking iron.

2. For castration only: castration only with the rubber ring.

3. For tailing only: tailing only with the rubber ring or the docking iron.

However there are other factors to be considered in conjunction with the above recommendations, and these are discussed.
ACKNOWLEDGEMENTS

All those who have experienced research as a student will know that the completion of a research project is only possible with direction and help from others. I would like to thank all those who have helped me over the past two years.

Thanks is particularly directed to my chief supervisor Professor David Mellor for his input and support both practical and philosophical. Also to my other supervisor Dr Ted Kirk for all his help and perseverance. Dr Robert Holmes helped with aspects of the experimental design and I appreciate his guidance.

I would like to thank Neil Ward and Nick Broomfield for all their technical help, especially in setting up the docking trials and help with the computer functions. Many thanks to the team who helped with the castration and tailing experiment: Professor Mellor, Dr Holmes, Neil Ward, Nick Broomfield, Rae Ming Ong, Roy Sparksman, Irene Hall, Debbie Anthony, Linda Randle and the Massey Sheep and Beef Cattle Research Unit staff, especially Lynley Watt, Tim Harvey and Mike Hogan. Thanks to Dr Keith Lapwood and Jane Candy for help and direction with the RIA procedures.

Also I would like to thank the many people in the Physiology and Anatomy Department for their comments and suggestions throughout the project, particularly Dr Heather Simpson and Dr Craig Franklin. Finally, I would like to thank my flatmates for all their support.
CONTENTS

CHAPTER ONE - GENERAL INTRODUCTION
1.1 Animal Welfare
1.2 Aims
1.3 Stress/Distress
1.4 Measurement of Stress/Distress
1.5 Pain
1.6 Stress and the Hypothalamic-Pituitary-Adrenal Axis
   1.6.1 Regulation
   1.6.2 Metabolic Effects
   1.6.3 Immunosuppressive Effects
   1.6.4 Anti-inflammatory Effects
   1.6.5 Theories on the Stress/Distress Response
1.7 Outline of Present Study

CHAPTER TWO - ANATOMY
2.1 Introduction
2.2 Materials and Methods
   2.2.1 Preparation
   2.2.2 Surgical Exposure of Nerves
   2.2.3 Neurophysiological Mapping
   2.2.4 Confirmation of Identification of Nerve Branches
   2.2.5 Preparation of Figures
2.3 Results
   2.3.1 Innervation of the Perineum
      A. Anatomical Arrangements
      B. Cutaneous Areas
   2.3.2 Innervation of the External Genitilia
      A. Anatomical Arrangements
      B. Cutaneous Areas
2.3.3 Innervation of the Tail

A. Cauda Equina
B. Anatomical Arrangements
C. Cutaneous Areas

2.4 Discussion

2.4.1 Innervation of the Perineum
2.4.2 Innervation of the External Genitalia
2.4.3 Innervation of the Tail

CHAPTER THREE - CASTRATION AND TAILING TRIAL

3.1 Introduction

3.2 Materials and Methods

3.2.1 Experimental animals
3.2.2 Experimental procedures
3.2.3 Experimental equipment
3.2.4 Blood sampling
3.2.5 Behaviour
3.2.6 RIA
3.2.7 Presentation of results

3.3 Results

3.3.1 Behavioural and cortisol responses
A. General summary
B. Control lambs
C. Rings
  (i) Castration plus tailing
  (ii) Castration only
  (iii) Tailing only
  (iv) Short-scrotum plus tailing
D. Knife
  (i) Castration plus tailing
(ii) Castration only
(iii) Tailing only
E. Docking iron
(i) Tailing only
(ii) Castration with the ring
plus tailing with the iron

F. Restlessness

3.3.2 Integrated cortisol responses
A. Control lambs
B. Tailing
C. Castration
D. Castration plus tailing
E. Effects of different tools
F. Miscellaneous treatments
G. ACTH injection

3.4 Discussion

3.4.1 Behavioural and cortisol responses
A. Responses to the ring
   (i) Validation of behavioural
   responses as indices of distress
   (ii) Comparison of behavioural
   responses to treatments
B. Responses to the knife
C. Responses to the docking iron
D. Restlessness

3.4.2 Integrated cortisol responses
A. Tailing
B. Comparison of castration plus
tailing, castration only and tailing
   only
C. Miscellaneous treatments
D. Conclusions
E. Age differences
CHAPTER FOUR - EFFECT OF HANDLING ON LAMBS
CASTRATED PLUS TAILED WITH THE KNIFE

106 4.1 Introduction
107 4.2 Materials and Methods
109 4.3 Results
109 4.4 Discussion

CHAPTER FIVE - SYNOPSIS

111 5.1 Integrated Cortisol Responses
111 5.2 Behavioural Responses
