AN ANALYSIS OF NEW ZEALAND SUICIDE ATTEMPTS IN 1980 - 1988

A thesis presented in partial fulfilment of the requirements for the degree of Master of Science in Statistics at Massey University, New Zealand

Ming Yik Tan
December 1991
Title of this thesis: AN ANALYSIS OF NEW ZEALAND SUICIDE ATTEMPTS IN 1980-1988

(1) (a) I give permission for my thesis to be made available to readers in Massey University Library under conditions determined by the Librarian.

(b) I do not wish my thesis to be made available to readers without my written consent for ... months.

(2) (a) I agree that my thesis, or a copy, may be sent to another institution under the conditions determined by the Librarian.

(b) I do not wish my thesis, or a copy, to be sent to another institution without my written consent for ... months.

(3) (a) I agree that my thesis may be copied for Library use.

(b) I do not wish my thesis to be copied for Library use for ... months.

DATE

07. 02. 1992
Suicide attempts have been of concern throughout the world especially in youths so that a study of the distribution of these acts is important and necessary. The aim of this thesis is to study the influence of certain demographic variables on suicide attempts.

The New Zealand Morbidity Data were merged with Population Census Data to obtain frequencies and rates of suicide attempts for subgroups of the population. The data were displayed in different ways to find the affect of various demographic variables such as sex, age, race, method of attempt, length of stay in hospital and geographical area. These variables were examined singly and jointly to reveal possible interactions.

The graphs and tables produced provided some confirmation of trends noted in the literature, namely that attempts were high for females and for adolescents but males tend to dominate the cases of successful suicide. Reasons for these differences are explored.

This study did not confirm the belief that suicide attempts are correlated with population density. The influence of time of year was examined and there was shown to be a trend of increased attempts in the warmer months.

The two sets of morbidity data, 1980 and 1988, enabled comparisons to be made over time.
ACKNOWLEDGEMENTS

I wish to express my sincere gratitude to my supervisor, Associate Professor RJ Brook, for his patience, enthusiasm and invaluable guidance throughout this project. Without his assistance I would not have made it this far.

A special thank to Massey University for the research funding in this project, to Massey Library for the research necessities and to the Computing Centre for the computer facilities.

To Gary Owen and Douglas Jones of the Palmerston North Hospital, many thanks for their willingness in supplying the valuable information.

Thanks to Richard for giving his time freely on proof reading this thesis and his help with computer software. I am also grateful to Kim and Robert for their generosity in spending their valuable time on proof reading. Aroon, Maree, Michael Ho and Rob, thanks for being there.

I would like to extend thanks and appreciation to Nancy and Leong Kiing for their caring and friendship.

To Jeanne, thanks for her patient understanding and frequent help but, most importantly for just being there always.

Finally, to Mum and Dad, brothers and sisters, thanks for their never ending love and support.
