Maximizing potential:
The effectiveness of Project K on self-efficacy, resilience, and connectedness

A dissertation presented in partial fulfilment
of the requirements for the degree of

Doctor of Clinical Psychology

at Massey University, Albany
New Zealand

Kirsty Furness

2013

ABSTRACT

This longitudinal study aimed to investigate changes in self-efficacy, resilience, and connectedness to school in students participating in Project K, a positive youth development programme. Eighty secondary school students were recruited from five schools across New Zealand. These formed two groups: a Project K group made up of 49 students, and a comparison group made up of 31 students. Over fourteen months, six waves of measurement were completed by Project K participants and four waves of measurement were completed by a comparison group. Self-efficacy was measured using the Project K Self-Efficacy Questionnaire, while resilience was measured using the Resilience Scale, and connectedness to school was measured using the Hemingway Adolescent Connectedness Scale. Preliminary analysis confirmed variance in individual and group data indicating more complex multilevel analysis would be beneficial in investigating changes in self-efficacy, resilience, and connectedness to school. As expected, the Project K group began with lower self-efficacy than the comparison group. However, after controlling for differences in initial status, Project K participants improved at a faster rate over the course of the programme than the control group. Gender difference in initial self-efficacy scores were noted, with females having higher self-efficacy than males, however these initial differences were unrelated to rates of change over time. Project K participants had lower resilience at the start of the study but after controlling for the initial group differences, the Project K group was found to improve at a faster rate when compared to the comparison group. There was no difference between groups at the start of the programme, or in rate of change over time in the connectedness to school variable, and no relationship between gender and changes in resilience or connectedness to school scores over time. To conclude, implications for future research and practice are discussed.

ACKNOWLEDGEMENTS

I feel very privileged to have been surrounded by so many amazing people while completing this research. Thank you to my two brilliant supervisors for your commitment to making this a quality project. To Dr Dianne Gardner, your positive and encouraging approach meant I always left our supervision meetings feeling highly motivated to continue. The quality and speed at which you provided feedback was exceptional! To Dr Paul Merrick, thank you for your support, encouragement, and wisdom, especially in the early days. This thesis would not have been completed to this standard were it not for you.

I am grateful to all the staff at the Foundation for Youth Development, but especially to Jo-anne Wilkinson, Graeme Dingle, and Julie Moore who saw the potential in this project. Julie, your ongoing support and availability to this project has been invaluable to me. A huge thank you to the Project K licensees, programme directors, and mentor coordinators, your commitment to youth development made it a pleasure to work with each of you. I would also like to extend my appreciation to those that made it possible to include a comparison group: thank you Ngaire, June, and Vicky for your support. Finally, to all the students who gave their time so generously to this project, thank you, without you this would not have been possible!

I would like to acknowledge Dr Richard Fletcher for generosity with your time and your statistical knowledge and input in the early stages of this research. Thank you to Dr Jaimie Veale and Matt Williams for your thoughtful, statistical advice, and for your exceptional proofreading skills. I would like to extend my gratitude to the Freemasons Charity for their financial support in the form of a Postgraduate Research Scholarship, and to the New Zealand College of Clinical Psychologists for their support in the form of the President's Award.

I would like to express my appreciation to the developers of the scales included in my research. The Foundation for Youth Development for the use of the Project K Self-efficacy Questionnaire; Dr Wagnild for the use of the Resilience Scale; Dr Karcher for the use of the Hemingway measure of adolescent connectedness; and Professor DiTommaso and Dr Flett.

A special thank you to my friends who shared the "doctoral room" space over the years, it has been a pleasure to work with each of you. I would also like to acknowledge Phil and Kevin who have shared this journey with me from the start. Your friendship, sense of humour, and

encouraging words over the years have meant a lot to me. I would also like to acknowledge a special friend Anmari, who inspired me in the early stages of this journey.

I would like to acknowledge my amazing family Beverley, Hilton, and Disa for your practical support, and for encouraging me to follow my dreams!

Finally, I would like to thank my wonderful husband Paul. Your belief in me, your support, and your positive encouragement has been so important to me on this journey.
