Exploring older adults’ understandings of disaster preparedness: A New Zealand perspective

A thesis presented in partial fulfillment of the requirements for the degree of Doctor of Philosophy in Psychology

at Massey University, Manawatū
New Zealand

Robyn Jean Tuohy
2014
Abstract

Individual preparedness for a disaster has centred on educating and encouraging people to protect themselves against injury and damage to assist with response and recovery after a disaster. Research on factors influencing individual disaster preparedness has focused on demographic and psychological variables, while socio-cultural contexts have received less attention. These omissions may help explain why more vulnerable population groups are disproportionately affected. Older adults are a rapidly increasing population group who are a vulnerable group at greater risk of negative effects during and after a disaster; however, little attention has been given to older adults’ perspectives about disaster preparedness.

This thesis is presented as four papers written for submission to peer reviewed journals, and explores older adults’ meanings and experiences about disaster preparedness from a social constructionist perspective. A series of 26 qualitative interviews using a narrative methodology was undertaken in 2012 with participants located in Wellington and Christchurch (median ages 84, and 80), New Zealand. Participants were recruited through a home support agency. Inductive thematic analysis of the data sets was undertaken, which attended to the influences of personal and socio-cultural contexts on disaster preparedness.

The first paper provides a conceptual argument for use of qualitative methodologies to further explore understandings of disaster preparedness. The second paper focuses on older adults’ household disaster preparedness in Wellington, which identified that older adults accepted personal responsibility for assembling and maintaining their survival kits. Practical concerns such as the ability to refill water bottles, monitor stock rotation, and ensure adequate medication supplies were identified to be difficult for some. Preparedness was also associated with the quality of supportive social relationships that could provide
assistance. The third paper is also based on the Wellington study, and provides a broader discussion about everyday preparedness. Meanings and experiences of preparedness were concerned with managing health decline, preparing for death, and the interpersonal complexity of negotiating their personal and social needs to remain independent in the community. The fourth paper discusses older adults’ experiences of preparedness during the Canterbury earthquake sequence (2010-2012). Disaster preparedness was primarily linked to the importance of social relationships; and a concern regarding a lack of age appropriate safety messages about personal protection. This thesis contributes to the literature on disaster preparedness by identifying age specific influences, which relate to managing personal health, social support and socio-cultural norms of independence. Some participants lacked informational, health and social resources, which would enable preparedness actions and the ability to respond effectively. The research from the Wellington and Christchurch studies identifies the need for coordinated, multidisciplinary age specific disaster preparedness planning to assist individual and community resilience.
Preface

This thesis is based on four research manuscripts. The first manuscript has been published in the journal, Disaster Prevention and Management. The second manuscript has been submitted to the International Journal of Emergency Management, and is under review. The third manuscript has been submitted to Ageing and Society, and is under review. The fourth manuscript has been published in the International Journal of Disaster Risk Reduction.

The ideas presented in this thesis are my own. My primary supervisor, Professor Christine Stephens helped me to structure my arguments and appears as a co-author on all papers that comprise this thesis. My secondary supervisor, Professor David Johnston provided further academic support and appears as third author on three of the papers.

Acknowledgements

In completing this thesis, I would like to thank all the older adults I interviewed. I feel privileged that you shared with me your insights and experiences to assist me in my research topic.

I would like to thank my primary supervisor Chris Stephens for her mentoring and encouragement over the last three years. I would also like to thank my secondary supervisor, David Johnston for his support. Thanks to Maureen and Denise for your conversations, friendship and support. Thank you to GNS Science for my scholarship funding and to the Joint Centre for Disaster Research, Massey University for financial assistance to attend conferences.

Completing a PhD is a unique journey, and I am so grateful to the very special travellers who accompanied me all the way - my fantastic and supportive husband, Pat; my children, Simon, Seb, Oliver and Emma; my daughters-in law Jessie and Andrea; and my granddaughter, Quinn, a new learner in the world. Thank you so much.

Chapter Six: Older adults’ disaster preparedness in the context of the September 2010 - December 2012 Canterbury earthquake sequence

Abstract

Background to Canterbury earthquakes

Method

The participants

Procedures

Data analysis

Results and Discussion

Attending to personal protection

Practical preparedness

Revising preparedness

Social preparedness: the role of social relationships

Conclusion

References

Chapter Seven: Discussion

Research aims

To explore influences on older adults’ disaster preparedness

To situate disaster preparedness within the context of old age

To explore the need for age specific disaster preparedness planning

Future research
