The Bacteriostatic Diglycosylated Bacteriocin Glycocin F Targets a Sugar-Specific Transporter

A thesis presented in partial fulfilment of the requirements for the degree of

Master of Science

in

Biochemistry

at Massey University, Manawatu

New Zealand

Kelvin Ross Drower

2014

Dedicated to Nana and Pop

Abstract

The increasing prevalence of antibiotic-resistance bacteria is threatening to end the antibiotic era established following Alexander Fleming's discovery of penicillin in 1928. Over-prescription and misuse of broad-spectrum antibiotics has hastened the development and spread of antibiotic resistance. This, combined with a lack of research and development (R&D) of new antibiotics by major pharmaceutical companies, may lead to a widespread recurrence of 'incurable' bacterial diseases. However while commercial R&D of antibiotics has waned, much research has been carried out to characterise bacteriocins, ribosomally-synthesised antimicrobial polypeptides thought to be produced by virtually all prokaryotes. Although hundreds of bacteriocins have been identified and characterised, only a handful of their cognate receptors on susceptible cells have been identified. Glycocin F is a bacteriostatic diglycosylated 43-amino acid bacteriocin produced by the Gram-positive bacterium *Lactobacillus plantarum* KW30 that inhibits the growth of a broad range of bacteria. The mechanism of action of glycocin F is unknown, however evidence suggested that glycocin F binds to cells via a N-acetylglucosamine (GlcNAc) specific phosphoenolpyruvate:carbohydrate-phosphotransferase system (PTS) transporter, as had been shown for lactococcin A, lactococcin B and microcin E492 that target a mannose specific PTS transporter. These other bacteriocins are, however, bactericidal suggesting that glycocin F uses a different mechanism of action to stop cell growth.

To test the hypothesis that one of the putative GlcNAc-specific PTS transporters identified in glycocin F-sensitive *L. plantarum* strains is the primary membrane receptor for glycocin F, a GlcNAc-specific PTS transporter gene knockout mutant was generated and analysed for glycocin F sensitivity. The GlcNAc-specific PTS transporter, *pts18CBA*, was successfully knocked out in *L. plantarum* NC8 which conferred the resulting *L. plantarum* NC8 Δ *pts18CBA* a degree of resistance to glycocin F confirming the GlcNAc-specific PTS transporter is a receptor of glycocin F. Additionally the genomes of wild-type (glycocin F sensitive) *L. plantarum* ATCC 8014, *L. plantarum* subsp. *plantarum* ATCC 14917, and multiple glycocin F-resistant mutants of these two strains were sequenced, assembled and comparatively analysed to identify changes consistent with increased resistance to glycocin F. Mutations, mapped to *pts18CBA* in all sequenced mutants, appeared to be deleterious to both the structure and function of PTS18CBA. A correlation of glycocin F resistance to the degree of mutation in the transmembrane domain of the *pts18CBA* gene was established confirming that glycocin F targets the EIC transmembrane domain of PTS18CBA.

Acknowledgments

Thank you to Dr Gill Norris and Dr Mark Patchett for the patience, tolerance, support and guidance that you have shown me

Gratitude goes to Associate Professor Murray Cox for the initial direction provided for the genome assembly

Thank you Trevor Loo, Soyeon Ahn and all the members of X-lab and IFS

A thank you goes out to the team at the MMIC, specifically Jordan, for the use of the camera

Thank you Stuart, Fareeda, Nat and Jan for your help both in and out of the lab

To all members of my family, especially Mum, Dad, Jennifer, Eric and Brendon, thank you for your support

Thank you Mel for teaching me the lessons of life

List of Abbreviations

3D	Three-dimensional
Å	Ångström (0.1 nm)
ABC	ATP-binding cassette
ADP	Adenosine diphosphate
ATP	Adenosine triphosphate
bp	Base Pair
CCA	Carbon catabolite activation
CcpA	Carbon catabolite protein A
CCR	Carbon catabolite repression
CDS	Coding DNA sequence
cm	Centimetre
CRE	Catabolite responsive element
ChbC	N,N'-diacetylchitobiose-specific PTS from <i>B. cereus</i>
da	Dalton
