## Abstract

In the seasonal, pastoral-based dairy system of New Zealand, it is important for herds to achieve consistently high reproductive performance. A large amount of research has been conducted into the adverse effects of high temperatures on the fertility of dairy cows. However, similar studies quantifying the effects of cold conditions in grazing systems have not been carried out. In New Zealand, farmers regularly blame the weather for low submission rates and conception to artificial insemination. This is because cows that appear to be cycling well, prior to the planned start of mating (PSM), then appear to stop cycling during the mating season, commonly in conjunction with adverse weather conditions, such as exposure to short or extended periods of cold, wet and windy conditions. Therefore, the aim of the current study was to investigate the effects of cold, wet and windy conditions on the reproductive performance of dairy cows, in order to support or refute this farmer perception.

Calving, mating, lactation and pedigree records were provided by CRV Ambreed for the 2013 season, as well as calving records for the 2014 calving period, for 6664 cows from 20 herds throughout New Zealand. Climatic variables for the same time period were obtained from NIWA and used to calculate a cold stress index, which was analysed against the reproductive performance of each herd. The mean 21-day submission rate (SR21) of all 6664 cows was 77% and the mean 21-day in-calf rate (21d-ICR) was 45%. The average cold stress index (CSI) during the mating period was  $967.4 \text{ kJm}^{-2}\text{h}^{-1}$ .

The results from this study showed that there was a linear and quadratic effect of CSI on both SR21 and 21d-ICR, with an increase as the conditions began to cool, followed by a decrease in both submission and conception rates as the CSI reach levels above  $1000 \text{ kJm}^{-2}\text{h}^{-1}$ . This pattern may indicate a survival mechanism which allows the cows to produce more heat, but once CSI levels reach around  $1000 \text{ kJm}^{-2}\text{h}^{-1}$ , cows are no longer able to maintain body temperature and sustain production, and fertility suffers.

Further investigations should focus on the specific threshold level for the decline of SR21 and 21d-ICR, as well as the length of exposure and mechanisms which cause the decline in submission rates and conception rates.

## Acknowledgements

I would firstly like to thank Chris Burke who provided me with the initial idea for the topic of cold stress, and for providing me with the industry insight required to form a basic knowledge of the need for this research, as well as your help and feedback throughout the project. It would not have been possible without you. I would also like to thank DairyNZ for their support with extraction of data from NIWA, in particular Hemda Levy, for your willingness to teach me the methods for extracting data, and for your programming which made it possible.

I would also like to thank CRV Ambreed and their farmers for their generous offer to provide herd reproduction data that was invaluable for the completion of this project. In particular I would like to acknowledge Andrew Medley for his willingness to help when I approached him and Sharon Browne for her help with getting permission from farmers to gain access to their herd records, and your patience with my continuous Insight and data exportation issues.

To my supervisors, Penny Back and Nicolas Lopez-Villalobos, I extend my deepest gratitude for helping to make this topic achievable, and for your endless positive and encouraging suggestions. To Nicolas, thank you for teaching me how to use SAS, and for your continuous help with the data analysis. To Penny, thank you for your continued feedback on my many draft chapters, and your positive feedback and advice. This thesis would not have been possible without the two of you helping me along the way, and supporting me with my topic choice.

Thank you to DairyNZ, Helen E. Aker, The Bing Trust, The C. Alma Baker Trust and Colin Holmes for their financial assistance in the form of scholarships. In particular, thank you to Susan Stokes from DairyNZ for your ongoing support and advice throughout my time at University, particularly whilst I was job hunting.

Finally, I would like to thank my friends and family for keeping me sane over the past 2 years and for your encouragement when things were tough. To the post-grad girls in my office, thank you for your entertaining banter, never-ending snack draw and infectious laughs. Finally, to James, thank you for your support and patience throughout this journey, and for your endless positive reassurance through the long days, weeks and months of study.
