# **Reporting Error in Aircraft Maintenance: are engineers reporting safety concerns?**

A thesis presented in partial fulfilment of the requirements for the degree of

Master of Aviation

At Massey University, Manawatu, New Zealand

Kirsty Twyman

2015

## **Abstract**

Aviation accidents seldom occur as the consequence of an isolated incident, but as the result of a series of contributing factors. The industry has focussed on detecting and predicting these casual factors to support accident prevention. However, the complexity of aircraft maintenance errors makes them somewhat harder to capture. One method adopted to support error identification is error-reporting systems.

The primary aim of study was to identify if reporting systems were being utilised by maintenance personnel. The secondary aim was to distinguish the factors that contribute to maintenance personnel rejecting reporting systems as a supportive tool. This was achieved through an online questionnaire. Due to a lack of research on error reporting and usability of reporting systems by aircraft maintenance personnel it proved difficult to use an existing survey, so survey questions were developed from an extensive literature review and a focus group made up of front-line personnel. Survey questions focussed on reporting system design, company attitude, error recognition and finally maintenance personnel personality patterns.

Results showed several issues affected reporting system usage including lack of company support, inadequate training, and lack of feedback. Perhaps the most significant discovery were engineers believing that they would report error, but were inadequately able to recognise error. Although regulatory authorities and organisations themselves are seeing the benefits of a positive reporting culture the current study showed there are still significant issues with current reporting systems, without these inhibiting factors being addressed the industry cannot solely rely on self-reporting to manage error.

## **Acknowledgements**

To my company who has supported me during the course of completing my Masters, especially to my work colleagues; without them carrying the burden of my normal workload I would have struggled to find enough hours in the day to complete this thesis.

To my thesis supervisor Dr. Andrew Gilbey, thank you for your patience and support throughout.

To my family, who were very understanding and supportive, giving me the time I needed, especially my husband having to listen to all the aviation related facts discovered during my my research.

And lastly, to all the engineers who took part in the survey: without you there would be no thesis. I appreciate the time and honesty that was given.
