MODELLING OF VOLCANIC ASHFALL

A thesis presented in partial fulfilment of the

requirements for the degree of

Doctor of Philosophy

in

Mathematics

at

Massey University, Albany

New Zealand

Leng Leng Lim

2006

Abstract

Modelling of volcanic ashfall has been attempted by volcanologists but very little work has been done by mathematicians. In this thesis we show that mathematical models can accurately describe the distribution of particulate materials that fall to the ground following an eruption. We also report on the development and analysis of mathematical models to calculate the ash concentration in the atmosphere during ashfall after eruptions. Some of these models have analytical solutions.

The mathematical models reported on in this thesis not only describe the distribution of ashfall on the ground but are also able to take into account the effect of variation of wind direction with elevation. In order to model the complexity of the atmospheric flow, the atmosphere is divided into horizontal layers. Each layer moves steadily and parallel to the ground: the wind velocity components, particle settling speed and dispersion coefficients are assumed constant within each layer but may differ from layer to layer. This allows for elevation-dependent wind and turbulence profiles, as well as changing particle settling speeds, the last allowing the effects of the agglomeration of particles to be taken into account.

Acknowledgments

I would like to express my appreciation to my two supervisors, Prof. Robert McKibbin and Dr Winston L. Sweatman of the Institute of Information and Mathematical Sciences at Massey University, for giving me the opportunity to engage in this PhD study. I thank them for their teaching, patience, encouragement and the motivation given to me throughout the time of my study. In addition, I would like to thank Prof. Robert McKibbin for giving me the opportunity to attend conferences during this period. This has helped to build my confidence.

Next I would like to thank Massey University for giving me a three year PhD scholarship to fulfil my dream.

I would also like to express my special thanks to Dr Shehenaz Adam from the University of Alaska, Dr Mark Harmer from Massey University and Dr Mark Nelson from the University of Wollongong for patiently proofreading this thesis.

I would like to thank Mr Samir Bishay and Mr Stephen Ford, staff members of the Institute of Information and Mathematical Sciences at Massey University, for computer support during the time of my PhD study.

I would like to thank Prof. Chuck Connor of the Department of Geology at the University of South Florida for providing eruption data and contributing his ideas about volcanic modelling.

Last but not least I thank my family who are awaiting in Singapore for the completion of my PhD study and all my friends for constantly giving me moral support. Most importantly, I thank you God for keeping me safe, healthy and for the company throughout these three years in New Zealand.
