Supplementation of palm kernel expeller to grazing dairy farms in New Zealand

**A thesis presented in partial fulfilment of the requirements
for the degree of**

**Doctor of Philosophy
in
Animal Science**

at Massey University, Palmerston North, New Zealand

Francisco Nogueira Dias

2010

Abstract

This thesis is composed of a series of studies to assess the nutritional value and characteristics of palm kernel expeller (PKE) for grazing ruminants. The chemical composition of PKE has shown high concentrations of neutral detergent fibre (NDF) (70.1 ± 0.39 g/100g DM) and fat (9.0 ± 0.37 g/100g DM), and a moderate content of crude protein (16.2 ± 0.42 g/100g DM), with very low concentrations of starch and sugar (0.3%) and reasonable gross energy content (18.6 ± 0.33 MJ/kg DM). *In sacco* digestion kinetics of PKE and pasture showed that PKE presented lower values for the soluble fractions in dry matter (DM), crude protein (CP) (25-27% and 37-38%, respectively) than pasture (41 and 52%), and the majority of the NDF in PKE was also present in the slowly degradable fraction (58-59%). The values for mixtures of pasture plus PKE were generally intermediate to those of the two feeds alone and the rate of degradation (k) for DM and fibre fractions did not differ significantly between feeds. But the rate of degradation for CP in PKE was about three to four times lower than that in pasture (6.7-9.8%/h and 33.8-48.4%/h, respectively), and the addition of PKE with pasture reduced the rate of protein degradation for the mixture to a rate similar to that of PKE alone (around 10%/h). *In vitro* net ammonia (NH₃) production decreased as the amount of PKE increased in the mixture with pasture, while PKE was only able to maintain a surplus of NH₃ for a short period of time; in contrast volatile fatty acids (VFA) yields were increased, with butyrate percentage being higher at the expense of acetate. In the *in vivo* trial with lambs, daily pasture DM intake was reduced as the amount of PKE plus molasses (PKEM) was increased in both periods, but total DM intake was not increased with the addition of PKE, except when the values were converted to DM intake per kg of metabolic liveweight. Independent of the pasture quality offered, there was a linear decrease in the apparent digestibility of DM and CP with the addition of PKEM in the diet; however NDF digestibility of the diet was only decreased when PKEM was fed with good quality pasture (period 1). The apparent digestibilities of PKEM of DM, CP, and NDF for PKEM were around 63.0%, 52.0% and 68.5%, respectively, with the estimated concentration of digestible energy (DE) of PKEM being approximately 12.8 MJ /kg DM. Addition of PKEM caused a decrease in the diet's DE concentration with high quality pasture (period 1), but an increase with low quality pasture (period 2). Faecal nitrogen (N) increased and urine N decreased when increasing

amounts of PKEM were fed in the diet, however, N retention and VFA concentrations were only increased by the addition of PKEM to the low quality pasture (period 2). The supplementation of either 3 or 6 kg of PKE to cows in late lactation grazing a restricted pasture allowance (20 kg DM/cow/day) decreased pasture intake, but overall total DM intake increased. Cows actually consumed only 2.7 and 3.6 kg PKE/cow of the 3 and 6 kg PKE offered/cow and presented substitution rates of 0.30 kg/kg and 0.54 kg/kg, respectively. Supplemented cows produced 0.86 to 0.94 kg milksolids/cow daily, respectively, while cows offered restricted pasture allowance only produced 0.76 kg milksolids/day. Supplemented cows had higher concentrations of milk fat than cows offered pasture only, and marginal returns of 42 and 53 g of milksolids/kg of PKE to cows offered 3 and 6 kg of PKE, respectively.

Acknowledgements

First of all, I would like to show my gratitude to the Brazilian government who provided me with a CAPES scholarship (CAPES - Coordenação de Aperfeiçoamento de Pessoal de Nível Superior).

I would like to sincerely thank my supervisors Dr. Jennifer Burke (Massey University), Prof. Colin Holmes (Massey University) and Dr. David Pacheco (AgResearch) for their scientific knowledge, helpful advice and all the effort you dedicated throughout the PhD, my thesis would not be the same without your ideas and comments. Particular thanks to Colin who provided general moral support, encouragement, and friendship during the toughest times of my PhD, on a personal and professional level. Thanks also go to Nicolas Lopez-Villalobos who provided expert knowledge about SAS.

Many thanks and appreciation goes to people from AgResearch who helped or were directly involved with my research, especially Fiona Burke, German Molano, Jason Peters and Katherine Lowe. Thanks also to Adrienne Cavanagh and Grant Taylor from FeedTech for the NIRS analyses, and Felicity Jackson, Leiza Turnbull and Vilma Rodriguez from the Nutrition Laboratory-IFNHH at Massey for the wet chemistry analyses and for let me use the laboratory facilities.

I would also like to acknowledge all the staff and students from IVABS for their help and effort during my experiments, especially Kim Dowson who helped me immensely during the *in vivo* and farm experiments. Thanks also to the staff of No. 4 Dairy Unity – Massey University, especially Natalia Martín who provided great support and work environment during my farm trial.

The friendship, help, and generosity of my fellow graduate students will always be remembered, especially Kathryn Hutchinson and Matthew Irwin, Danny van der Linden, Felusha D. Adeyinka, Joanne Kerslake, Hye-jeong, Gina, Rajesh Sharma and Preet Singh. Thanks to all the South-American friends I've met during my stay in New Zealand, specially Karin and Carlos (Hannika and Phillip), Javier and Ana (Francisco and Santiago), Javier and Belen, José Ramirez, Alfredo and Loreto (Martina and Sofia), it was a pleasure to have spent this time with you. To the Brazilian community here in New Zealand, specially my great friends from the “Diretoria”: Daniela (Koko), Luis (Mineiro), Matheus and Flavia (Gauchos); and also Ana Paula, Gustavo and Silvia; life in Palmy was much more enjoyable with you guys around.

My family and friends must be thanked for their support and encouragement, with special recognition to my dad, my mother, brothers and sisters that kept me on track until the end of the thesis.

Last but not least, I'd like to acknowledge my wonderful wife and friend, Ieda, for her support, patience and love throughout my PhD. I will be forever grateful to you as you were always by my side even on the toughest moments of our journey in New Zealand. I would not have finished this thesis without you. And my sweetheart, my baby daughter Sofia, born in New Zealand, whose love is worth it all, even during the sleepiness nights.

Table 5.7. Calculated ^a intake, losses (faecal and urinary) and retention of nitrogen (N) of diets containing different amounts of palm kernel expeller plus molasses (PKEM) at maintenance and <i>ad libitum</i> , during periods 1 ^b and 2 ^c	121
Table 5.8. Linear regression equations for intake, faecal and urinary losses, and retention (intake less urinary and faecal losses) of nitrogen (N) based on the % of palm	

kernel expeller plus molasses (PKEM) in the diet, with data for lambs fed at maintenance and *ad libitum* included, in periods 1 and 2. 122

Table 5.9. Linear regression equations for faecal and urinary losses, and retention of nitrogen (N) based on the amount of nitrogen consumed in the diet, with data for lambs fed at maintenance and *ad libitum* included, in periods 1^a and 2^b. 125

Table 5.10. Average concentration of rumen volatile fatty acids and molar percentages of acetate, propionate and butyrate for the four diets containing different amounts of palm kernel expeller and molasses (PKEM) and fed to lambs at maintenance or at *ad libitum* during periods 1 and 2. Molar ratios are given for acetate:propionate (A:P). Least square means (LSMeans) \pm SE (standard error) from three samples collected across 4, 8 and 12 hours after feeding lambs. 129

Table 6.1. Chemical composition of the pasture and palm kernel expeller (PKE) offered to cows throughout the experiment period. 146

Table 6.2. Daily pasture allowance, pre and post grazing pasture height and mass, dry matter (DM) intake and substitution rate for cows fed either a restricted pasture allowance plus 0 (RGOP), 3 (RGLP), or 6 (RGHP) kilograms of fresh PKE/cow/day or *ad libitum* pasture allowance (HG0P). 147

Table 6.3. Chemical composition (g/100 gDM) of diets eaten by cows during the experiment. Data are calculated based on the composition of PKE eaten by the supplemented treatments, and the composition of pasture cut at 4, 6, 6 and 8 cm above the ground for the restricted pasture allowance (RG0P), restricted pasture allowance plus 3 (RGLP) and 6 (RGHP) kilograms of fresh PKE /cow/d and *ad libitum* pasture allowance (HG0P), respectively¹. 149

Table 6.4. Milk production and changes in live weight (LW) and body condition score (BCS) of cows fed either a restricted pasture allowance offered either 0 (RG0P), 3 (RGLP) or 6 (RGHP) kilograms of fresh PKE /cow/day or an *ad libitum* pasture allowance (HG0P) without any supplement. 150

Table 6.5. Fatty acid composition of pasture and palm kernel expeller (PKE) offered to cows during the experiment; and fatty acid composition of bulk milk fat samples taken from cows fed a restricted pasture allowance offered either 0 (RG0P), 3 (RGLP) or 6 (RGHP) kg of fresh PKE /cow/day or an *ad libitum* pasture allowance (HG0P). 151

Table 7.1. Chemical composition of palm kernel expeller obtained from different sources in New Zealand. 158

Table 7.2. Mean values for dry matter (DM), crude protein (CP), neutral detergent fibre (NDF) and acid detergent fibre (ADF) degradation characteristics of palm kernel expeller (PKE) defined by the soluble fraction (A), slowly degradable fraction (B), fractional disappearance rate (k), lag phase, undegradable residue (U), potential degradability (PD). 159

List of Appendices

Appendix 3.1. Soybean meal used as a standard to measure variations between incubations. Least square means of soybean meal (SBM) dry matter loss at different times and rumen parameters (pH, ammonia (NH ₃) and volatile fatty acid (VFA) concentrations) observed during the four <i>in sacco</i> incubations.	198
Appendix 4.1. <i>In vitro</i> pH and ammonia (NH ₃) concentration (mMol/L) of freeze-dried and ground lucerne and soybean meal (SBM) incubated in four <i>in vitro</i> incubations. <i>In vitro</i> NH ₃ and pH data of the standard feeds are the least square means of triplicate samples at each time and incubation.	199
Appendix 4.2. Average <i>in vitro</i> net ammonia production of PKE mixed with either ryegrass and white clover (RW) (Experiment 1; a), or ryegrass-only (Ryegrass) (Experiment 2; b) after 2, 6, and 12 hours of incubation.	200
Appendix 4.3. Experiment 1: cows fed lucerne chaffage plus PKE: Concentrations of total VFA, acetate, propionate, <i>n</i> -butyrate, and minor VFA (iso-butyrate, <i>n</i> -valerate and iso-valerate, <i>n</i> -caprionic) of diets with different proportions of PKE and ryegrass and white clover (RW).	201
Appendix 4.4. Experiment 2: cows fed lucerne chaffage plus PKE: Concentrations of total VFA, acetate, propionate, <i>n</i> -butyrate, and minor VFA (iso-butyrate, <i>n</i> -valerate and iso-valerate, <i>n</i> -caprionic) of diets with different proportions of PKE and ryegrass-only (Ryegrass).	202
Appendix 4.5. Experiment 2: cows fed lucerne chaffage only: Concentrations of total VFA, acetate, propionate, <i>n</i> -butyrate, and minor VFA (iso-butyrate, <i>n</i> -valerate and iso-valerate, <i>n</i> -caprionic) of diets with different proportions of PKE and ryegrass-only (Ryegrass).	203
Appendix 5.1. Digestible energy (DE) of diets containing different amounts of pasture and PKEM and the weight gain (Wgain) of lambs fed those diets, including data for	

lambs fed either at maintenance or ad libitum, during period 1 (◆) and 2 (○). Points with green colour in the chart symbolize pasture-only samples. 204

Appendix 5.2. Gross energy (GE) and digestibility of energy (digestible energy divided by gross energy) in diets containing different amounts of pasture and PKEM, including data for lambs fed either at maintenance or ad libitum, during period 1 (◆) and 2 (○).

Points with green colour in the chart symbolize pasture-only samples. 204

List of Abbreviations

A	soluble fraction
ADF	acid detergent fibre
AFRC	Agricultural and Food Research Council
AIC	Akaike information criteria
B	slowly degradable fraction
BCS	body condition score
BIC	Bayesian information criteria
BW	body weight
C.V	coefficient of variation
CHO	carbohydrates
CLA	conjugated linoleic acids
CNCPS	Cornell Net Carbohydrate and Protein System
CP	crude protein
dL	decilitre
DM	dry matter
DMD	dry matter digestibility
ED	effective degradability
EE	ether extract
eNDF	effective fibre
ERDP	effective rumen degradable protein
FA	fatty acids
FCM	fat-corrected milk
g	grams
GE	gross energy
GIT	gastro-intestinal tract
HA	herbage allowance
HG0P	<i>ad libitum</i> pasture allowance and no PKE
k	rate of digestion of the slowly degradable fraction
kg	kilograms
kp	fractional outflow rate
L	litre

LSmeans	least square means
LW	liveweight
$LW^{0.75}$	metabolic liveweight
m^2	square metre
MAF	Ministry of Agriculture & Forestry, New Zealand
ME	metabolizable energy
mg	milligram
mL	millilitre
MP	metabolizable protein
MPOC	Malaysian Palm Oil Council
MR	meter readings
MS	milk solids
MUN	milk urea nitrogen
N	nitrogen
NDF	neutral detergent fibre
NH_3	ammonia
NIRS	near infrared reflectance spectroscopy
ns	not significant
NZ	New Zealand
OMD	organic matter digestibility
P + PKE	pasture plus PKE
PD	potential degradability
PK	palm kernel
PKE	palm kernel expeller
PKEM	palm kernel expeller plus molasses
PKM	palm kernel meal
QDP	quickly degradable protein
R^2	coefficient of determination
RDP	rumen degradable protein
RG0P	restricted pasture allowance and no PKE
RGHP	restricted pasture allowance plus 3kg of fresh PKE
RGLP	restricted pasture allowance plus 6kg of fresh PKE
RMSPE	root mean square prediction error
RSMPE	root square mean prediction error

RUP	rumen undegradable protein
RW	ryegrass and white clover
Ryegrass	ryegrass-only
s.d	standard deviation
SBM	soybean meal
SDP	slowly degradable protein
SE	standard error
SR	substitution rate
SSS	soluble sugars and starch
t	time
TMR	total mixed ration
U	undegradable fraction
UK	United Kingdom
US	United States
VFA	volatile fatty acids
vs.	versus
Y	herbage mass
