SOME ECONOMIC AND NUTRITIONAL ASPECTS

OF DIFFERENT GROWER AND LAYER RATIONS

IN EGG PRODUCTION

A Thesis presented in partial fulfilment of the requirements for the degree

in Animal Science

at

Massey University

STEPHEN EDGAR JAMES SWAN

ACKNOWLEDGEMENTS

I am grateful for the supervision of both Mr. M. R. Patchell and Professor A. R. Frampton in this thesis.

I am also indebted to Professor R. J. Townsley for his advice and constructive comment.

Thanks are also due to the Poultry Research Centre Staff for help with data collection; Ars. E. Self for the competent typing; and my wife for her encouragement.

PREFACE

Chapter One of this thesis presents background information on the rearing of laying pullets and describes an experiment evaluating a series of rearing rations (with continuous variation of the levels of three major ingredients) in terms of overall profitability.

Chapter Two looks particularly at the layer phase, and considers possibilities of reducing feed costs in this phase. An experiment evaluates a series of layer rations (with continuous variation of the levels of three major ingredients) in terms of overall profitability.

The final chapter presents an appraisal of the methods available for economic analysis of livestock rations, and discusses the problems associated with their application in layer nutrition. A profit function is suggested as a means of economic evaluation.

LIST OF TABLES.

Table.					Page
1.3.1	Examples of Starter, Grower and Developer Diets for Replacement Pullets	•		•	7 (i
1.9.1	Percentage composition of rations; chemical and ingredients together with a calculated cost per 2,000 lb. ton if delivered in bulk .	•	•	•	25
1.12.1	Treatment Mean Body Leights from Hatch to 47 weeks. (lb.)	o	•	•	30
1,12,2	Treatment mean shank lengths (cm) from hatch to 24 weeks age	•		•	31
1.12.3	Treatment means for Hen—day Food Consumption periods from hatch to 32 weeks of age (lb./bird).	•	•	•	33
1.12.4	Summary of treatment means for Age at First Egg (days); Body Weight (lbs.) at first egg, H H and H D egg number; and mortality ().		•	•	35
1.12.5	% of eggs laid in the various grades for the ni treatments, over the laying period; total mass egg weight produced; and "weighted" egg weight	of	•	•	36
1.12.6	Treatment mean values for Haugh Unit, yolk colomeat and blood spots (untransformed) of eggs broken out at 41 weeks of age	ur,		•	37
1.13.1	Body Weight Changes during the Experiment .	•		•	40
2.6.1	% Composition of the 14 Layer Rations	•	•	•	59
2.9.1	Initial (22 wks) and final (58 wks) body weights and weight gains		•	•	62
2.9.2	H D Food Consumption per bird per treatment for the 36 week laying period	•		•	63
2.9.3	Egg Production/bird from 22-58 weeks of age .	•	•	•	64
2.9.4	Egg Weight and Egg Quality Measurements per treatment made on samples taken for breakout at 56 weeks of age	•	•	•	65
3.3.1	Equations and regression data for trial CN/50.	•	•	•	90
3.4.1	Summary of Regression information (LT/19) .	•	•	•	93
3.4.2	Productivity (egg mass per day) related to nutrintake (protein and energy per day) for II/19.	ient	•	•	94
3.5.1	Profit Function Calculations (# per hen) for CN	50 .		•	96
3.5.2	Profit Function Calculations(\$ per hen) for LT/	19 .			98

LIST OF FIGURES.
