Molecular characterisation of the *EAS* gene cluster for ergot alkaloid biosynthesis in epichloë endophytes of grasses

A thesis presented in partial fulfilment of the requirements for the degree of

Doctor of Philosophy
in
Molecular Genetics

at Massey University, Palmerston North,
New Zealand

Damien James Fleetwood

2007

Abstract

Clavicipitaceous fungal endophytes of the genera *Epichloë* and *Neotyphodium* form symbioses with grasses of the family Pooideae in which they can synthesise an array of bioprotective alkaloids. Some strains produce the ergot alkaloid ergovaline, which is implicated in livestock toxicoses caused by ingestion of endophyte-infected grasses.

Cloning and analysis of a plant-induced non-ribosomal peptide synthetase (NRPS) gene from *Neotyphodium lolii* and analysis of the *E. festucae* E2368 genome sequence revealed a complex gene cluster for ergot alkaloid biosynthesis. The *EAS* cluster contained a single-module NRPS gene, *lpsB*, and other genes orthologous to genes in the ergopeptine gene cluster of *Claviceps purpurea* and the clavine cluster of *Aspergillus fumigatus*. Functional analysis of *lpsB* confirmed its role in ergovaline synthesis and bioassays with the *lpsB* mutant unexpectedly suggested that ergovaline was not required for black beetle (*Heteronychus arator*) feeding deterrence from epichloë-infected grasses. Southern analysis showed the cluster was linked with previously identified ergot alkaloid biosynthetic genes, *dmaW* and *lpsA*, at a subtelomeric location. The ergovaline genes are closely associated with transposon relics, including retrotransposons, autonomous DNA transposons and miniature inverted-repeat transposable elements (MITEs), which are very rare in other fungi.

All genes in the cluster were highly expressed *in planta* but expression was very low or undetectable in mycelia from axenic culture, including under nitrogen-, carbon- or phosphate-limited conditions. Comparative analysis of the *EAS* gene cluster in four different epichloë strains showed marked differences in gene expression and ergot alkaloid synthesis. Gene order is conserved in each strain although evidence for recombination between two MITEs and expansion or reduction of a simple sequence repeat (SSR) at a single intergenic region was observed. Heterologous expression of a candidate regulatory gene, *laeA*, from *Aspergillus nidulans*, which is a global regulator of secondary metabolism in aspergilli, did not affect *eas* gene

expression. This, along with phylogeny and microsynteny analysis, suggests there is not an orthologue of this gene in epichloë.

This work provides a genetic foundation for elucidating biochemical steps in the ergovaline pathway, the ecological role of individual ergot alkaloid compounds, and the regulation of their synthesis *in planta*.

Acknowledgements

Like raising a child, so I am told, it takes a community to complete a PhD. Thank you so much to everyone that had input into this thesis, whether intellectual, experimental or emotional.

Thank you to my supervisors, Richard Johnson and Barry Scott. You made a great team and you were, in different ways, wonderful supervisors: rigorous, supportive and astute. Thank you both.

Thank you to everyone at AgResearch for a fun, stimulating environment. Special thanks to Tina Voisey for your support and many, many laughs. Thank you Greg Bryan for doing all the boss stuff I don't know much about but know to be important. Thanks Mike Christensen for imparting a measure of your immense knowledge and passion for epichloë endophyte biology. Thanks Wayne Simpson for showing me what to do with dirt and other very interesting stuff. Thanks Geoff Lane and Brian Tapper for several enjoyable discussions about chemistry and biology. Thanks Anar Khan for superlative bioinformatics support from afar. Thank you to members of the lab: Shalome, Linda, Charlotte, Steven, Kurtis, Lee, Jasmin, Jen, Anu and Melle, for a supportive, occasionally hilarious, environment. Thank you Helal Ansari, Michelle Thornton and Kim Richardson, for failed, but fun, attempted experiments. Thank you Sue, Julie, Nadia, Maree, Kathy, Dale and everyone else that keeps the world going around without names on papers.

Thanks to the members of ScottBase, Massey University, past and present, for being so inclusive. Special thanks to my science heroes Brendon Monahan and Carolyn Young for many stimulating discussions. Thank you Ruth Wrenn for running around after me from 2 km; and always with a smile.

Thank you to my parents for your support and encouragement from across the sea.

Several people need acknowledgement for technical and/or intellectual input into the data presented in this thesis. Aiko Tanaka provided the ps12 sequence that started the ball rolling. Chris Schardl, University of Kentucky, allowed access to the

pre-release of the *E. festucae* E2368 genome sequence, which added immensely to this work. Geoff Lane, Karl Fraser and Albert Koulman performed or interpreted LC-MS/MS analyses. Andrew Griffiths provided some of the genomic DNA samples and Jennifer Pratt performed some of the diagnostic PCRs described in Table 6.1. Anar Khan prepared the phylogenetic tree in Figure 4.5. Mike Christensen, Wayne Simpson and Anouck De Bonth provided biological material and took special care of my plants. Alison Popay provided expertise and materials for design and interpretation of the insect feeding choice test, Lisa Evans scored the feeding damage and John Koolard performed statistical analysis.

Finally, Lisa Paton. Above all else your love and support has kept me going. Thank you.

This PhD was truly a community effort and I have had a wonderful time taking part in it. To everyone that helped along the way, named and unnamed, family, friends, workmates, thank you.

This research was supported by a grant (C10X0203) from the New Zealand Foundation for Research, Science and Technology (FRST). The *E. festucae* E2368 genome sequencing was supported by a grant (EF-0523661) to Chris Schardl, Mark Farman (University of Kentucky) and Bruce Roe (University of Oklahoma) from the US National Science Foundation (NSF), and a grant (2005-35319-16141) to Chris Schardl from the US Department of Agriculture National Research Initiative (NRI).
