ASPECTS OF SELECTION IN AN

INTERBRED FLOCK BASED ON

PERENDALES CROSSED WITH

MERINO X ROMNEY EWES

A THESIS PRESENTED IN PARTIAL FULFILMENT

OF THE REQUIREMENTS FOR THE DEGREE OF

MASTER OF AGRICULTURAL SCIENCE

IN

ANIMAL SCIENCE

AT

MASSEY UNIVERSITY

CARLOS ALFONSO LEYVA FERNANDEZ
1986

ABSTRACT

Genetic, phenotypic and environmental parameters were estimated from hogget traits recorded on 237 Perendale x (Merino x Romney) ewe hoggets between 1977 and 1984. Non-genetic effects on weaning weight (WW) for 634 ewe and ram lambs were analysed. A selection objective and criteria was defined and appraised for the flock.

The traits examined were hogget liveweight (HLW), greasy fleece weight (GFW), clean fleece weight (CFW), quality number (QN), character grade (CHG), handle grade (HG), cotting grade (CG), soundness grade (SG), greasy colour grade (GCG), scoured colour grade (SCG), staple length (SL), total crimp number (TCN), clean scoured yield (Y), mean fibre diameter (MFD) and crimps per centimetre (CPC).

The least squares method of fitting constants was used to estimate the major environmental factors influencing the traits studied. Heritabilities (${\bf h}^2$) were obtained by the daughter-dam regression (DDR) and daughter-dam correlation (DDC) methods. The genetic (${\bf r}_{\rm G}$), phenotypic (${\bf r}_{\rm p}$) and environmental (${\bf r}_{\rm E}$) correlations were calculated by the daughter-dam method.

The estimates of environmental effects agree in most cases with the published estimates. Between year differences were important sources of variation and had a highly significant effect on all traits except SCG. Rearing rank effect was found to be the most important source of variation for WW and HLW. Age of dam and sex had a highly significant effect on WW. Neither rearing rank nor age of dam exerted any significant influence on wool traits.

The estimates of heritability calculated by daughter-dam regression method were: HLW (0.16), GFW (0.17), CFW (0.24), QN (0.42), CHG (0.38), SG (0.02), GCG (0.38), SCG (0.09), SL (0.12), TCN (0.08), Y (0.41) and MFD (0.29).

Genetic and phenotypic correlations calculated among some hogget traits were respectively: HLW x GFW (0.67 and 0.66); HLW x CFW (0.62 and 0.56); HLW x SL (0.79 and 0.44); HLW x MFD (-0.45 and 0.24); GFW x CFW (0.87 and 0.94); GFW x SL (0.37 and 0.60); GFW x MFD (-0.98 and 0.38); CFW x GCG (0.52 and 0.02); QN x MFD (-0.79 and -0.30); SG x MFD (0.73 and -0.21); GCG x SCG (0.87 and 0.38); GCG x Y (0.96 and 0.04) and SCG x Y (0.77 and 0.00).

Lifetime economic weights derived using the marginal profit method were calculated to define a selection objective for the flock studied. The traits included in the objective were number of lambs weaned (NLW (dam)), WW, CFW, MFD and SCG. Besides the traits in the objective, HLW, GFW, QN and GCG were included as selection criteria. The appropriate selection indices for ram hoggets (I₁), ewe hoggets (I₂) and lambs (I₃) were respectively:

 $I_1 = 4.66 \text{ NLW (dam)} + 0.62 \text{ HLW} + 0.10 \text{ WW} + 3.91 \text{ GFW}$ - 1.70 MFD + 0.50 GCG.

 $I_2 = 4.79 \text{ NLW (dam)} + 0.61 \text{ HLW} + 0.04 \text{ WW} + 1.99 \text{ GFW} + 0.23 \text{ QN} + 1.60 \text{ GCG}.$

 $I_2 = 4.87 \text{ NLW (dam)} + 0.48 \text{ WW}.$

ACKNOWLEDGEMENTS

I would first like to express my special appreciation and gratitude to my supervisor Dr G.A. Wickham for his guidance and advice during my studies. This gratitude is extended to Professor A.L. Rae and Professor R.D. Anderson for their sharing of knowledge. i Gracias Maestros!

Special thanks are due to my parents Francisco Leyva L. and Maria Fernandez C.; to Dra. Clara Velazco de Leyva; to Maria Ysela, Carla Valerie, Carlos Ernesto and all my relatives and friends whose absence need to be recompensed.

A very appreciative thank you is extended to the New Zealand Government and to I.N.I.P.A - Ministry of Agriculture of Peru for the financial support during my stay at Massey University.

To Dokter Hewan Uning Zubaidah, my Indonesian friend, whose friendship showed me that this world could be different.

I want to thank Mr D. Garrick, Mr W. Abell, John Rendel,
Dr S.N. McCutcheon, Mr P. Whitehead, Mrs M.M. Hilder, Mrs A.F.
Barton, Sheryl-Anne Newman, Anne McClelland, Hassanein Elgabass,
Mr M. Carter, Mr M. Wycherley, Kathy Noble, Janine Cornaga,
Glenys Lei, Ray and Luz Mary Dunick, Peter and Carol Coombes,
CATHSOC, INTERFEL and the Takaro Rotary Club for their roles
played during my studies and residence in New Zealand.

Thanks are also extended to Mrs Valerie Oram for her skilful typing of this thesis within the restricted time available.

Finally, I express my gratitude and commitment to the peasants of the Highlands of Peru for their silent encouragement to obtain this degree.
