**Genetic studies of *Phytophthora* on
Theobroma cacao from East New Britain
and Bougainville (Papua New Guinea)**

A thesis presented in partial fulfilment of the degree of

Master of AgriScience (Horticulture)

**at Massey University,
Palmerston North, New Zealand**

James Butubu

2016

ABSTRACT

DNA was extracted from 14 *Phytophthora* isolates from *Theobroma cacao* plants (SG2 hybrids, hybrid derived clones and Trinitario varieties) collected from New Britain and Bougainville in Papua New Guinea (PNG). A fragment of the mitochondrial genome cytochrome b (cytb) region was amplified from these DNAs using the polymerase chain reaction (PCR) and compared to cytochrome b sequences from *Phytophthora palmivora* and other *Phytophthora* (two isolates previously isolated from cocoa lesions and two *P. palmivora* isolates obtained from culture collection-Australia). All isolates were identical in their cytb gene sequence and similar to *P. palmivora*. Additionally, we sequenced the mitochondrial genomes of four isolates from PNG. The syntenic arrangement of genes in one complete assembly was compared with other published mitochondrial genomes. The sequences of four mitochondrial genes (COII, nad2, rps10 and SecY) from the four PNG isolates were aligned with orthologues from accessions of *P. palmivora* and other *Phytophthora* species available in the NCBI Genbank reference database. A concatenated data matrix was produced with 2,295 homologous sequence positions. 34 accessions of *Phytophthora* (including 14 *P. palmivora*) were used to construct a maximum likelihood tree of phylogenetic relationships. This reconstruction recovered all 10 major clades of *Phytophthora* previously reported. In this phylogenetic reconstruction, the four PNG isolates were clearly identifiable as *P. palmivora* and these were closely related to the Clade 4 *Phytophthora* species *P. megakarya* and *P. quercetora*. Of the genes analysed, COII showed greatest variability, resolving *P. palmivora* into three sub groups. COII was sequenced in all *P. palmivora* isolates from PNG and used to reconstruct an ML tree. The phylogenetic analyses suggested a potential origin for the PNG strain of *P. palmivora* in Samoa. Syntenic comparisons of *P. palmivora* and other clade 4 species identified a potential target for developing a Loop Mediated Amplification (LAMP) assay for *P. palmivora* near the atpH gene region. DNA amplification primers were designed for this region using PrimerExplorer, V4, Eiken Chemical CO.Ltd) and validated against available DNAs for Clade 4 and other *Phytophthora* species.

TABLE OF CONTENTS

	Page No.
CHAPTER 1	
1.1 Cocoa history and uses.....	1
1.1.1 Cocoa and PNG economy.....	3
1.1.2 Cocoa diseases pose a major constraint to increasing yield and income.....	5
1.2 A history of research on <i>Phytophthora</i>	6
1.2.1 New species discovery prior to 2000.....	7
1.2.2 New species discovery post 2000.....	7
1.3 <i>Phytophthora palmivora</i>	9
1.3.1 Life cycle of <i>P. palmivora</i>	10
1.3.2 Morphology of <i>P. palmivora</i>	10
1.3.3 Epidemiology of <i>P. palmivora</i>	11
1.4 Disease Management for <i>P. palmivora</i>	12
1.4.1 Improved tolerance to <i>P. palmivora</i>	12
1.4.2 Management and sanitation of trees.....	13
1.4.3 Screening for <i>P. palmivora</i> resistance.....	14
1.4.4 Pod Inoculation screening method.....	15
1.5 Diagnostics for <i>P. palmivora</i>	15
1.5.1 The Polymerase Chain Reaction.....	17
1.5.2 Dideoxy DNA Sequencing.....	19
1.5.3 High Throughput (NGS) DNA sequencing	22
1.5.4 DNA sequence analysis.....	23
1.5.5 Targeting the nuclear genome.....	24
1.5.6 Targeting the mitochondrial genome.....	24
1.5.7 Isothermal DNA amplification tests.....	25
1.6 Aims and objectives of the present study.....	26

CHAPTER 2

2.1 Introduction.....	27
2.2 <i>Phytophthora palmivora</i> collections.....	28
2.3 Culturing of <i>Phytophthora palmivora</i> isolates.....	28
2.3.1 Culturing of <i>P. palmivora</i> isolates.....	28
2.3.2 Microscopic examination of cultured <i>P. palmivora</i>	30
2.3.3 Harvesting and storage of <i>P. palmivora</i> mycelium for molecular analysis.....	31
2.3.4 Microscopic examination of cultured <i>P. palmivora</i>	31
2.3.5 Harvesting and storage of <i>P. palmivora</i> mycelium for molecular analysis.....	31
2.4 DNA extraction.....	31
2.4.1 Sample homogenisation.....	31
2.4.2 Genomic DNA extraction.....	32
2.4.3 Evaluation of DNA quality and quantity.....	33
2.5 PCR amplification of mitochondrial loci.....	33
2.6 Enzymatic purification of PCR products.....	34
2.7 Sanger sequencing of PCR products.....	34
2.8 Processing of Sanger sequence data.....	34
2.9 Next generation sequencing and assembly of whole mitochondrial genomes....	34
2.9.1 High through-put sequencing of PNG <i>P. palmivora</i> isolates.....	35
2.9.2 Mitochondrial genome assembly.....	35
2.9.3 Mitochondrial genome annotation.....	36
2.10 Relationships of PNG <i>P. palmivora</i> based on mitochondrial genes.....	36
2.11 Designing primers for LAMP amplification of <i>P. palmivora</i> specific targets.....	38
2.12 Testing of the LAMP assay.....	39
2.12.1 Initial testing of LAMP primers using PCR.....	39
2.12.2 Optimisation of the LAMP assay.....	39

2.12.3 Specificity of the LAMP assay.....	40
2.12.4 Sensitivity of the LAMP assay.....	40

CHAPTER 3

3.1 Introduction.....	42
3.2 Genetic diversity of <i>P. palmivora</i> isolates.....	42
3.3 Whole mitochondria genome sequencing and comparison.....	43
3.3.1 Sequencing statistics.....	43
3.3.2 Genome assemblies.....	43
3.3.3 Annotation of the <i>P. palmivora</i> genome.....	45
3.4 Relationships of PNG <i>P. palmivora</i> based on mitochondrial genes.....	45
3.4.1 DNA sequences and data matrices.....	45
3.4.2 Nucleotide substitution models.....	45
3.4.3 Relationships of PNG <i>P. palmivora</i> based on mitochondrial genes.....	46
3.5 Characterising PNG <i>P. palmivora</i> isolates for cox1-cox2 sequence variation.....	48
3.6 Designing primers for LAMP amplification of <i>P. palmivora</i> specific targets.....	49
3.7 Testing of the LAMP assay.....	52
3.7.1 Initial testing of LAMP primers using PCR.....	52
3.7.2 Optimisation of the LAMP assay.....	52
3.7.3 Specificity of the LAMP assay.....	52
3.7.4. Sensitivity of the LAMP assay.....	52

CHAPTER 4

4.1 Introduction.....	56
4.2 Cytochrome b gene analyses of PNG isolates.....	56

4.3 The mitochondria genome of <i>P. palmivora</i>	57
4.4 Phylogenetic relationship of <i>P. palmivora</i> based on four genes.....	58
4.5 Cox2 gene sequence variation.....	59
4.6 The Design of LAMP primers.....	60
4.7 Testing and implementation of LAMP in diagnostics.....	61
4.8 Concluding Statement.....	61
4.9 Future Work.....	62

CHAPTER 2

Figure 2.1 Regional Context of current study in New Britain and Bougainville.	
The location of Samoa (Apia) has also been indicated.....	27
Figure 2.2 Map of PNG showing <i>P. palmivora</i> collection sites (base map from d-maps.com).....	28
Figure 2.3 Photographs of <i>Theobroma cacao</i> pods from Bougainville (A-C) and East New Britain (d-F) with dark discolouration consistent with <i>P. palmivora</i> infection. <i>Phytophthora</i> isolated from these pods is among that analysed in the present study. Isolate codes (see Table 2.1) for pods are – A, Buin3; B, Buin4; C, Buka2; D, Kerv; E, Raul; F, Tav (office).....	29
Figure 2.4 The process of isolating and culturing <i>P. palmivora</i> from diseased <i>Theobroma cacao</i> pods collected in the field. The media pods are surface sterilised by first spraying with an insecticide (A) and then washing in a NaOCl bath (B). Sterilised pods (C) then have a hole drilled into them; surface scrapings are taken from a diseased pod (D) and packed into this hole (E). The inoculated media pods are covered and incubated in the dark at 24°C to allow the <i>P. palmivora</i> infection to develop (F).....	30
Figure 2.5 Flowchart for Nextera DNA library preparation.....	35

CHAPTER 3

- Figure 3.1** A visual presentation of the completed mitochondria gene map of *P. palmivora* isolate from Raulavat, East New Britain. The genes and rRNA, coding regions (green) area also shown. Arrows indicate transcriptional orientation..... 31
- Figure 3.2** Maximum likelihood phylogeny from the combined analysis of atp9-nad9, cox1-cox2, rps10 and secY regions. Numbered nodes indicate clades recognised by Blair et al. (2008), numbers associated with branches are bootstrap support values obtained for 500 replicates.. 48
- Figure 3.3** The regions coloured show where each primers sequence is located as identified by the primer explorer software. Primer sequences are given by the reference sequence (*P. palmivora*1). Where there is dots (no letters) the nucleotide are identical to the reference genome..... 51
- Figure 3.4** Electrophoresis of PCR products, Ladder, 1=negative control, 2=isolate 3, 4=isolate 6 and isolate 11 amplified by F3/B3 primers, 5=negative control, 6, 7, and 8 are same isolate but amplified with FIB/BIP primers..... 53
- Figure 3.5** Electrophoresis of LAMP products. Ladder, 1=negative control, 2=ratio of 1: 4, 3=ratio of 1:6 and 4=ratio of 1:8 F3/B3 to FIB/BIP primer without Loop primer, 5=Negative control, 6= ratio of 1: 4, 7=ratio of 1:6, 8=ratio of 1:8 F3/B3 to FIB/BIP primer with loop primer, isolate but amplified with FIB/BIP primers. Only one isolate of *P. palmivora* was used..... 53
- Figure 3.6** Different species of *Phytophthora* tested for DNA amplification using LAMP primers , Ladder, 1=negative control, 2= *P. palmivora* (PNG-Raul) , 3=*P. palmivora*

(Chest nut-ICMP 1770) ,4= *P. palmivora* (Papaya-ICMP14517) ,
5=*P. capitosa*, clade 9, ICMP17567), 6=*P. agathicidae*,
(NZFS3128, clade 5), 7=*P. cryptogea* NZFZ 4156-clade 8)
and 8=*P. cinnamoni* (ICMP20276-clade 7)..... 54

ACKNOWLEDGEMENTS

I wish to thank my supervisors Nick Roskruge, Richard Winkworth and Peter Lockhart for their excellent supervision. A special mention of thanks also goes to Trish McLenachan for her assistance with lab work at Massey. This work would not have been possible without support from the Ministry of Agriculture (PNG), New Zealand Aid, the New Zealand BioProtection CoRE, and most of all my family and friends! Special acknowledgement also goes to my colleagues Mrs Olisha Wesley and Mary Paul Marfu for their technical assistance in culturing the fungal pathogen at PNGCCI.
