**EVALUATION OF FORAGE YIELD AND QUALITY OF  
SORGHUM, SUDANGRASS AND PEARL MILLET  
CULTIVARS IN MANAWATU**

A thesis presented in partial fulfilment of the requirements

for the degree of

**Master of Agricultural Science**

in Agronomy

at Massey University, Palmerston North

New Zealand

**MASSEY UNIVERSITY**

**DAVISON SILUNGWE**

**2011**

## **Abstract**

Sorghum, sudangrass and pearl millet are versatile summer forages which are able to be grazed or conserved as silage; however there is little recently published information on the performance of these crops in New Zealand. A trial was carried out at Massey University, Palmerston North, in order to compare forage yields, forage quality, crop morphology and seed quality of four sorghum *x* sudangrass hybrids (Pac 8421, Pac 8423, Pacific BMR and Bettagrazze), two sudangrass (Superdan 2 and Sprint), one sweet sorghum (Sugargraze); and one pearl millet (Nutrifeed) cultivars, sown on the 8 and 21 December 2009. Two harvests were taken at approximately 100 cm plant height, leaving a residual of 15 cm. Nutritive values of the whole plant: crude protein (CP), neutral detergent fibre (NDF), acid detergent fibre (ADF), metabolisable energy (ME), and soluble sugars and starch (SSS) were determined, using near infrared reflectance (NIR). Accelerating ageing was used to assess seed vigour.

Yields were significantly ( $P = 0.005$ ) affected by plant date; mean yield for the 2<sup>nd</sup> plant date (11,356 kg DM/ha) was significantly lower than the 1<sup>st</sup>, (12,792 kg DM/ha). Pac 8423 (13,953 kg DM/ha), Sugargraze (13,262 kg DM/ha), Bettagrazze (12,704 kg DM/ha) and Sprint (12,426 kg DM/ha), were the highest yielding group. There was a significant interaction ( $P < 0.0001$ ) between sowing date and cultivar, for yield at the second harvest; cultivar differences for the first sowing date were larger than that for the second, which suffered more from cool autumn temperatures.

Crude protein ranged from 10.3 to 18%, NDF 57.2 to 65.2%, ADF 32.9 to 35.5%, ME 10.1 to 11 MJ/kg DM and SSS 1.2 to 13.9%. CP and ME were negatively associated with plant height and yield, whilst CP was strongly and positively related to ME.

Despite late sowing, most cultivars achieved high yields of relatively high quality forage. Significant differences amongst cultivars were observed. New cultivars displayed the potential to increase forage yield.

## **Acknowledgements**

I would like to take this opportunity to express my heartfelt appreciation to my supervisors Dr James Millner and Mr Craig McGill of the Institute of Natural Resources, Massey University, for their suggestions, warm encouragement, endless patience, understanding, enthusiasm, constructive criticism and guidance, in conducting the research and the writing of this thesis. Also, for the spiritual, emotional, physical and mental support they rendered to me and my family during our stay in New Zealand: without them, my study would have been impossible.

The technical assistance provided by Mr Mark Osborne, Ms Kay Sinclair and Ms Ruth Morrison of the Institute of Natural Resources, Massey University, during this study, is acknowledged with many thanks.

I am also indebted to my friends, especially Francis and my fellow students, for their valuable assistance with this research.

Many thanks to the New Zealand Agency for International Development (NZAID) for my Masters programme scholarship, since without them I would not have been able to undertake this study.

My thanks also go to Pacific Seed New Zealand and Genetic Technologies Ltd, for supplying the seed and the Animal Nutrition Laboratory, the Institute of Food Nutrition and Human Health, Massey University, for forage quality analysis and the Hill laboratories, Hamilton, for soil analysis.

A very special thanks goes to my wife, Carol and our children, Wasuwila and Wawanaswe, for their continual love, support, understanding, sacrifice and resilience during my studies. My thanks also to my late sister, Grace, for being my source of inspiration, and I miss her dearly.

Finally, my studying in New Zealand is due to the Almighty God for the provisions, blessings and grace given to me.
