# Biological and Molecular Characterisation and Crystallisation of Infectious Bursal Disease Virus and Its Major Capsid Protein

A thesis presented in partial fulfilment of the requirements for the degree of Doctor of Philosophy in Veterinary Science at Massey University, Turitea, Palmerston North, New Zealand.

CHAI, Yew Fai 2001

The bravest are surely those who have the clearest purpose.....and go out to meet it.

Thucydides

### **Abstract**

Infectious bursal disease virus (IBDV) is prevalent in most of the poultry producing areas worldwide and causes severe economic losses resulting not only from clinical disease and mortality, but also from the immunosuppressive effect in subclinically infected flocks. The research on IBDV in this thesis is divided into two main parts. In the first part, studies were carried out on the IBDV inadvertently introduced into New Zealand in 1993. Prior to that date, the country had been free from the virus. IBDV was successfully isolated from seven flocks of subclinically infected and/or seronegative chickens in SPF embryonating eggs, adapted to cell culture and identified by EM, immunocytochemistry and RT-PCR test. To evaluate the efficacy of the serological method used in the screening programme of the IBDV eradication scheme, a study was undertaken to compare three diagnostic methods. The study demonstrated that serological testing is not a reliable method for the detection of IBDV infection in New Zealand broiler flocks because antibodies may not have developed to detectable levels by the time of slaughter. Histological examination of affected bursae allowed the demonstration of IBD-like lesions, but these needed to be differentiated from those caused by other agents. The immunocytochemistry test was able to detect early IBDV infection and provided a rapid, definitive diagnosis.

Using the immunocytochemistry test to perform a longitudinal study of IBDV infection in a broiler and a layer farm, results showed the birds were infected as early as 6 to 7 days of age. The prevalence of IBDV infection was estimated to be 55% in the broiler flock. The results showed that the serological test had a sensitivity of 28.57% and a specificity of 73.68% for detecting the New Zealand IBDV strain infection. This indicated that there should be further evaluation of the use of serological testing as the sole method for the detection of IBDV infected farms in the current control scheme.

An *in-vivo* pathogenicity study using IBDV derived from a bursal tissue homogenate and carried out in SPF chickens demonstrated the low virulence of the virus present in

New Zealand. Molecular analysis of the hypervariable region of the VP2 gene of two IBDV isolates obtained in 1997 and 1998 showed they are more closely related to attenuated strains than other strains. In all three phylogenetic analyses, using neighbour joining, parsimony and split decomposition, the NZ isolates are closely related to attenuated strain PBG98 and Cu1 but split away from Australia 002-73, variant E, classical and very virulent strains. Both results support the hypothesis that an attenuated strain of IBDV was inadvertently introduced into the New Zealand poultry population in 1993.

In the second part of this thesis, studies on the structure of the IBDV virion and its major capsid protein were initiated by X-ray crystallography. The purification of IBDV for crystallisation and crystallisation trials are described. Several viral crystals were produced from the trials but only weak diffraction was obtained from these crystals.

With the aim of studying the structure of the major capsid protein of IBDV (VP2) and investigating the major antigenic site on this capsid protein, the vp2 gene was cloned and expressed, the protein purified, and preliminary crystallisation trials performed. Recombinant VP2 was successfully expressed from a baculovirus expression system. The purification of the recombinant VP2 was also completed in the study and preliminary crystallisation screens determined several conditions favouring the production of crystals.

# **Acknowledgements**

The completion of this thesis would not have been possible without the help and support from all the people around me. First of all, I would like to thank my co-supervisor (my chief supervisor for the first two and a half years), Dr. Joanne Meers, for her support, friendship and advice throughout my research projects. I also thank my chief supervisor, Dr. Colin Wilks for his constant interest and advice on my research and all his efforts during the final phase of my thesis writing. Sincere thanks also to my off-campus co-supervisor, Dr. Neil Christensen, for his support and help in the field work.

For my research in the second part of this thesis, I was lucky to have Dr. Gill Norris from the Institute of Molecular BioSciences to be my co-supervisor. I am gratefully for her enthusiasm, advice and infinite patience in teaching this veterinary student (me) about protein biochemistry and X-ray crystallography research.

I also wish to acknowledge all the following people for their unselfish sharing of time and knowledge with me:

Laurie Sandall for all her help in the virology lab since I jointed the group.

Dr. Magda Dunowska and Dr. Derelle Thomson for all their advice on my molecular biology research projects.

Dr. Maurice Alley for his help and advice with histopathology examination.

Pam Slack and Pat Davey for all the histological processing and introducing me all the walking tracks in Manawatu.

Jane Schrama for her helps in preparation of media and autoclaving.

Peter Wildbore for assistance with the purchasing of reagents.

Dr. Nigel Perkins and Daniel Russell for all their help with software and statistical analysis.

Dr. Peter Lockhart for help with phylogenetic analysis software.

Douglas Hopcroft and Raymond Bennett for their help in electron microscopy.

Deborah Frumau and Trevor Loo, for their friendship and assistance in the X-lab.

All the staff and post-graduate students in the IVABS and IMBS for all the discussions and help throughout my research project, especially thanks to the "touch rugby" team members from IVABS for two good years of training and games.

I am especially grateful to Dr. Daniel Gaudry, Director of research and development, Merial, USA for generously supplying me with the IBDV culture for the virus crystallisation study.

Thanks to all the owner of the poultry farms involved in the field studies and all the chickens sacrificed for the research purpose.

Special thanks for the scholarship and academic assistance from Prof. Hugh Blair and Mrs. Allain Scott of the IVABS postgraduate office. The approval for the experiments described in the thesis from the Massey University Animal Ethics Committee and the Doctoral scholarship from the Doctoral Research Committee, Massey University are also highly appreciated.

Thanks to e-mail technology, I was able to have good discussions and advice from colleagues in New Zealand and overseas. Especially thanks to Dr. Vernon Ward from Otago University, New Zealand; Dr. Joseph Giambrone from Auburn University, USA and Dr. Darah Jackwood from Ohio University, USA. Dr. Mittur Jagadish from CSIRO, Australia kindly sent me the anti-IBDV monclonal/polyclonal antibodies.

Finally, the greatest person I wish to thank is my wife, for her sacrifice, support, love and sharing the difficult times in my research process. Without her support in the past three years, this thesis would not have been completed in time.
