## Biopolymer Networks: Image Analysis, Reconstruction and Modeling

A thesis presented in partial fulfilment of the requirements for the degree of

> Doctor of Philosophy in Physics

at Massey University, Manawat $\bar{u}$ , New Zealand

Pablo Hernandez-Cerdan 2018

It's not about the end, it's all about the path. ¡Buen camino!.

### Abstract

The aim of this work is to extract the architecture of biopolymer networks from 3D images. This is motivated to further understand non-affine regimes, found during network formation and in low-density biopolymer networks, where the geometry of a network has a fundamental role in defining its mechanical properties.

Firstly, developed image analysis tools were extended to 3D and contributed to high-performance open-source libraries for image analysis. These developments in isotropic wavelets will help in extracting realistic networks by removing spurious noise generated during image acquisition.

Secondly, images of biopolymer gels from transmission electron microscopy (TEM), were used to reliably extract the network architecture. The imaged material was also studied with small-angle x-ray scattering (SAXS), and the comparison showed a strong agreement for network-size features.

Thirdly, spatial graphs were extracted from the image. A one-to-one map is provided between image and graph, keeping all the geometric information from the image. This then opened the door to using analytical tools from the complex networks field to characterize images.

Finally, statistical distributions extracted from three graph properties were used to reconstruct a completely in-silico network using a simulated annealing technique to generate new networks. This can be used as a computational exploration tool of how network behavior depends on network architecture.

### Acknowledgements

A special thank to my supervisor Bill Williams whose support, openness, and vision of science is encouraging. As Brad would say, I will be forever indebted to your supervision and I add: and from all the stuff that I have learned from you beyond academia, specially your humane values and the love for dumplings. Thanks to Brad Mansel, Leif Lundin and Andrew Leis for the collaboration comparing scattering and imaging techniques, Allan Raudsepp for providing the confocal microscopy images for actin, and to all my group mates from the Biophysics and Soft Matter group, for all the shared moments, and how easy they made my adaptation to a new country. Finally, I am grateful to the MacDiarmid Institute for constantly providing the enrichment opportunity to meet other peer students and researchers, and to the staff of the Institute of Fundamental Sciences for its kindness dealing with all sort of issues.

In the personal side, I would like to thank my family, from who I have inherited, directly and indirectly, all the principles I stand for and made me realize how privileged I am to have them. And Martica! Without you here in New Zealand this quest would have been impossible, or faster, who knows, but way less enjoyable for sure. It has been a pleasure habernos re-encontrado por kiwi-land. And even we got married, in English!!, crazy, but made me feel extremely fortunate. Thanks really for all your support.

This research was supported by the MacDiarmid Institute, the Riddet Institute, and Massey University, New Zealand.
