**THE ACQUISITION OF KNOWLEDGE FROM MULTIPLE EXPERTS  
IN THE DOMAIN OF SENSORY EVALUATION PANEL TRAINING**

A Thesis Presented in Partial Fulfilment  
of the Requirements for the  
Degree of Master of Philosophy in Social Science  
(Computer Science)  
at Massey University, New Zealand

**SIMON ANTONY EWING-JARVIE**

**1994**

## Acknowledgements

I would like to express my sincere thanks to my supervisor, Elizabeth Kemp. Not only for her support and guidance throughout the project but particularly for her grace in maintaining the delicate equilibrium between allowing me the freedom to study independently and still keeping me moving toward the objective. My thanks must also go to the many staff of the department of Human Resource Management at Massey University who assisted me with ideas on layout and with proof-reading.

A special mention must go to the staff of the Sensory Evaluation Unit at the New Zealand Dairy Research Institute, Palmerston North. In particular, I would like to thank Sharon Wards, for believing in the project at the outset, and also Pam Marks and Anne McPherson. Without their time and interest the research contained in this thesis could not have been completed.

The drive to achieve in life is not innate and this thesis would not be complete without a thank you to my father who has set the example for life long learning from as far back as I can remember. I hope this work helps to motivate my children, Timothy and Amy, to achieve in the same way that Robert Ewing-Jarvie's unquenchable thirst for knowledge has inspired me. Thankfully, the children are too young to have noticed their father's odd behaviour during the two years that this research has been conducted.

Simon Ewing-Jarvie

## Abstract

Knowledge acquisition is the elicitation and representation of human expertise and is one of the first steps taken in constructing an expert system. It has often been cited as the 'bottleneck' in expert systems development due to the labour intensive processes needed to deal with the expert human. Various researchers have proposed methodologies for improving both the accuracy and the productivity of the process. This has ranged from manual to automated methods as well as examining what the expert might be thinking during a study of the conscious activity.

This research has focused on the issues involved in the manual elicitation of knowledge using multiple experts in the same domain. It utilises the transcripts of semi-structured interviews and discourse analysis techniques to construct the domain layer of a knowledge base, employing the KADS methodology.

The findings highlight the importance of the relationship between the knowledge engineer, organisation and the human experts. Issues such as motivation, organisational commitment and communication skills feature as key indicators of the likely success of an expert system development project. While automated acquisition assists with productivity, it works against the development of relationships within the project team and the trade-off must be carefully considered by the project manager.

## Table of Contents

1 Introduction	1
1.1 An overview	1
1.2 Nature of the research	1
1.3 Structure of the thesis	2
2 Knowledge Acquisition	4
2.1 General	4
2.2 Knowledge acquisition techniques	6
2.2.1 Interviewing	6
2.2.2 Psychologically-based techniques	7
2.2.3 Secondary data	9
2.3 Models of problem solving	9
2.3.1 Method to task approaches	9
2.3.2 Generic task approaches	12
2.3.3 The KADS approach	12
2.3.4 Role limiting approach	13
2.3.5 Second generation techniques	14
2.3.6 Future generations	14
2.4 Criteria for selecting experts	16
2.5 Use of multiple experts	17
2.5.1 General	17
2.5.2 Need for multiple experts	17
2.5.3 Examples of the use of multiple experts	17
2.5.4 Problems of multiple expertise sources	18
2.6 Conclusion	19
3 Sensory Evaluation Panels	20
3.1 Introduction	20
3.2 Sensory evaluation defined	20
3.3 Selecting panellists	21
3.4 Training panellists	21
3.5 Panel leaders	22
3.6 Statistical aspects of panels	22
3.7 Suitability as a domain	22
4 Methodology	24
4.1 General	24
4.2 Detailed methodology	24
4.2.1 The domain	24
4.2.2 The experts	25
4.2.3 The interviews	26
4.2.4 Initial analysis	26
4.2.5 Further analysis	29
4.2.6 Development of consensus	32

4.3 Conclusion ..... 33

5 Analysis ..... 34

5.1 Interviews ..... 34

5.2 Transcript analysis ..... 34

5.2.1 Phase ‘A’ analysis ..... 35

5.2.2 Phase ‘B’ analysis ..... 35

5.3 Expert 1 ..... 35

5.4 Expert 2 ..... 37

5.5 Expert 3 ..... 39

5.6 Consensus vocabulary ..... 41

5.7 Development of domain layer model ..... 44

5.8 Conclusion ..... 57

6 Discussion ..... 59

6.1 Introduction ..... 59

6.2 Key findings ..... 59

6.3 Organizational commitment ..... 60

6.4 Identification of experts ..... 60

6.5 Research design ..... 61

6.6 Organisational and individual commitment ..... 62

6.7 Processing of interview data ..... 62

6.8 Reduction of transcripts ..... 63

6.9 Discourse analysis of individual transcripts ..... 64

6.10 Achievement of consensus ..... 64

6.11 Benefits to the experts ..... 65

6.12 Benefits to the organisation ..... 65

6.13 Conclusions ..... 65

7 Conclusions ..... 67

7.1 A modelling approach ..... 67

7.1.1 The value of manual elicitation ..... 67

7.2 Discourse analysis ..... 67

7.3 Issues relating to multiple experts ..... 68

7.3.1 Contamination potential ..... 68

7.4 Organizational issues ..... 69

7.5 Redefining the role of the knowledge engineer ..... 69

7.6 Directions for future research ..... 69

7.7 Closing summary ..... 70

# **Chapter 1**

## **Introduction**

### **1 Introduction**

#### **1.1 An overview**

The field of artificial intelligence and its offspring, expert systems has been the subject of considerable interest in recent years. Various international initiatives have added to this impetus including Japan's Fifth Generation Strategy, the European Community's KADS Programme and the British Alvey Programme for Advanced Information technology. Expert systems utilise human expertise and there has been much research (Clancey, 1985; Boose & Gaines, 1989; Wielinga, Schreiber & Breuker, 1991) into knowledge engineering techniques. Despite the proliferation of research projects in the area, there is general agreement (Clancey, 1985; Marcus, 1988; Musen, 1989; Wielinga, Schreiber & Breuker, 1991) that the major bottleneck in the construction of an expert system remains the acquisition of knowledge. This problem is further confounded when multiple experts in the same domain are involved in the knowledge acquisition process. There is a limited amount of research on the acquisition of knowledge from multiple experts in the same domain.

#### **1.2 Nature of the research**

This research was exploratory and its objective was to identify issues that will affect knowledge acquisition from multiple experts in the same domain. While there are now second and third generation software applications which facilitate the development of a knowledge base (Marcus, 1988; Musen, 1989; Gaines & Linster, 1990), it was felt that too little was understood about some basic relationships between knowledge engineer, expert and domain and that automation would blur the issues. For this reason, first generation techniques such as interviewing and discourse analysis were employed. This proved to be a valuable feature of the research as it enabled the effect of the relationship between knowledge engineer and expert to be fully explored within the context of organizational dynamics.

### 1.3 Structure of the thesis

In the second chapter the literature on knowledge acquisition is reviewed and definitions are offered for the main terms and ideas implicit in the research. It is pertinent to note that most of the published research relates to knowledge acquisition involving a single expert, rather than multiple experts.

Expert systems are symbolic, heuristic, and can cope with uncertain information. The field of sensory evaluation is of a similar nature, being involved with the use of the human senses to evaluate flavour, aroma, texture, mouth feel and colour in a quantifiable, scientific manner. Members of a panel are trained and led by sensory evaluation experts in order to enable them to carry out these experiments. The Sensory Evaluation Unit of the New Zealand Dairy Research Institute, based in Palmerston North is one of the main providers of trained panels in the country and as such, was in the position of having three expert panel leaders on its staff. This is contrary to the normal situation where expertise is scarce or unavailable and so offered a unique opportunity for the study of knowledge acquisition using multiple experts. The third chapter provides an overview of the field of sensory evaluation as well as discussing its suitability as a domain.

Chapter four details the methodological processes employed in the research. As is the nature of exploratory research, a research goal was deemed more appropriate than hypotheses. This chapter describes how the verbal data was gathered and transcribed. It explains how original interview transcripts were reduced via discourse analysis techniques to eventually become concepts and relations. Despite the best efforts of researchers, this process will remain relative to the skill of the knowledge engineer and so consistency is only maintained, for the purposes of research by using one knowledge engineer, as is the case here. However, it was noted that the use of one knowledge engineer does result in a bottleneck of administrative tasks.

The concepts and relations derived from discourse analysis form the basis of the domain layer, in the KADS methodology. KADS is explained more fully in

chapter 2, while the concepts and relations are shown in chapter 5. The KADS methodology was selected from among several alternatives as it was clear that many of the tasks involved in training a sensory evaluation panel were generic, for instance selection, discrimination and administration. KADS offered the most clearly documented framework upon which to model these activities. As the DRI had requested that the outcome be a single model of knowledge, it was then necessary to achieve consensus and derive one set of concepts and relations from the three experts' individual sets. Chapter 5 also addresses the processes which led to the successful development of a single domain layer.

The significant issues identified in this research are examined in chapter 6. These findings relate particularly to social science concepts such as organizational and individual commitment, communication, motivation and workload. This chapter serves to highlight the inseparability of computer science from the disciplines which seek to explain what energises and sustains human behaviour.

Conclusions regarding the findings are highlighted in the final chapter, chapter seven. The verbal data transcripts and output from supporting analysis is shown in full in the appendices. Despite the volume of the data, it was felt that its inclusion not only provided completeness to this thesis, but also offered the opportunity for secondary analysis in the future.
