**Where we are and how we got here:
An institutional ethnography of the
Nurse Safe Staffing Project in
New Zealand**

Abstract

Frontline nurses in New Zealand hospitals still work on short-staffed shifts 18 years after they began to express concerns about unsafe staffing and threats to patient safety. The Nurse Safe Staffing Project and its strategies (Escalation planning and the Care Capacity Demand Management Programme) were designed to address the incidence and risks of short-staffing. After a decade, these strategies are yet to yield tangible improvements to frontline nursing numbers. Using institutional ethnography, I have charted a detailed description and analysis of how aspects of the strategies of the Nurse Safe Staffing Project *actually work* in everyday hospital settings. Competing institutional knowledge and priorities organise what is happening on short-staffed shifts, and nurses are caught in the crossfire. The central argument throughout this thesis is that nurses' vital situated knowledge and work are being organised by and overridden in this competitive institutional milieu. I show how what actually happens is consequential for nurses, patient care, and staffing strategies. This analytical exploration contributes knowledge about nurses' situated and intelligent compensatory work on short-staffed shifts, how this knowledge is displaced by abstracted institutional knowledge, and the competing social relations present in environments where nurse-staffing strategies are negotiated.

Acknowledgements

First, I wish to express my thanks to and gratitude for my family and whanau because they have supported the most and suffered the most over the course of this thesis. You know who you are, and I **really** could not have done this without you.

To the frontline nurses who provided data, but also to all frontline nurses who show up every day out of a commitment to patients and the profession. THANK YOU! If it was easy, everyone could do it.

Thank you to all the research participants. Collectively we have created something no single one of us alone could know, and that will always be significant. Thank you for your contribution.

To my supervisors, Professor Jenny Carryer, Dr Kerri-Ann Hughes, and Dr Janet Rankin, I am incredibly thankful for your guidance, critique, support, and wisdom.

I also thank the online institutional ethnography club. I have been so grateful to 'talk institutional ethnography' every month with a group made up of both novice and skilled researchers. I am also grateful for the opportunity to attend the workshop in Canada and meet Dorothy Smith and hear her brilliant mind in action.

My thanks also to Pip, Jane and Rachel for being practice readers and identifying inconsistencies, misspellings, flow issues and troubles with apostrophes. I am grateful for your time and feedback.

Notes for the reader

To assist the reading of this thesis, I offer these notes

- I use the term 'Nurse Safe Staffing Project' to describe the entirety of efforts directed at resolving nurse-staffing shortages in NZ. The Nurse Safe Staffing Project includes the collection of campaigns, enterprise bargaining agreements, industrial action, the safe staffing healthy workplaces committee of inquiry, the safe staffing healthy workplaces unit and nurse staffing strategies designed to reduce the incidence and risks of short-staffing
- After the introduction to each chapter (except chapters 2 & 9), a glossary will detail the terminology and abbreviations relevant to that chapter. Chapter 2 constitutes an in-depth explanation of institutional ethnography that precludes the need for a glossary. In chapter 4, the glossary appears immediately ahead of part II – the Nurse Safe Staffing Project.

All images of the Care Capacity Demand Management (CCDM) Programme tools, (except those I have created for this research report) are under copyright owned by the New Zealand Ministry of Health, 2017 and were provided by the Safe Staffing Healthy Workplaces Unit and used with permission, or from the public CCDM website.

-
- There are two patient acuity systems in use in NZ hospitals (Onestaff and TrendCare). None of the participants used Onestaff, therefore most references are to TrendCare. All references to TrendCare are based on peoples' personal and individual knowledge and experience of learning, implementing, and using the system in NZ hospitals. The exception is the reference to the copyrighted TrendCare Gold Standards provided by TrendCare CEO Cherrie Lowe and used with permission.

All references to Smith pertain to Dorothy Smith unless the presence of initials indicates otherwise.
