THE USE OF DOGS TO DETECT NEW ZEALAND REPTILE SCENTS

A thesis presented in partial fulfilment of the requirements for the
degree of Master of Science in Zoology at Massey University,
Palmerston North, New Zealand.

Clare Melody Browne

2005

ABSTRACT

This study examined the ability of domestic dogs (*Canis familiaris*) to detect the scent of the Cook Strait tuatara (*Sphenodon punctatus*), Marlborough green gecko (*Naultinus manukamus*) and forest gecko (*Hoplodactylus granulatus*).

Handlers from two local dog training clubs with a total of 20 dogs participated in this study. The dogs' capacity to detect human and reptiles scents was evaluated in a series of trials. Each trial required the dogs to identify a different target scent, and consisted of nine replicate scent discrimination exercises. In the exercises the dogs were presented with a line of cloths. One or more of the cloths contained scent and the dogs were commanded to locate a specific scented cloth. Tuatara and gecko seats, sloughed skins and paper towels captive individuals had been sitting on were used to imbue the cloths with reptile scent.

The dogs were able to identify human, tuatara and gecko scents with average success rates of up to 96.3%, 93.7% and 86.7%, respectively. The dogs could detect fresh reptile seats, seats that had been exposed in native forest for two weeks and discriminate between several different reptile scents. The detection successes were significantly higher than would be expected if the dogs were selecting cloths at random ($p = 0.05$). The average results of each trial and the success rates of individual dogs were significantly different at both dog clubs ($p = 0.000$).

The results indicate that the methods used in this study are a good model for scent discrimination research, and dogs could be used to detect tuatara and gecko species for conservation work. Dogs may provide an alternative to the visual methods currently used to locate these reptiles.

ACKNOWLEDGEMENTS

Thank-you to my supervisors: Professor Kevin Stafford and Associate Professor Robin Fordham. Your support (Robin) and unrelenting harassment (Kevin) helped me complete this thesis in the end.

I would like to thank all of the handlers and their dogs that participated in this research; I could not have done it without your help. Thanks to everyone at the Tararua Allbreeds Dog Training Club: Karen Belcher with Abbie; Bronwen Burnette with Topaz; Sue Cooper with Celtic; Cherie Gear with Bonn; Robyn How with Polly; Meredith Pitcher with Rowan; Sandra Mohekey with Runa; and Janet Young with Kayla and Tasha. Thank-you also to everyone from the Feilding Dog Training Club: Robyn Annand with Chelsea and Willy; Linda Avery with Cassie; Mel Blair with Elsa and Spice; Amber Gorinski with Titan and Zeus; Linda Guinness with Sambuca; Diane Lock with Kayla; Maggy Ludlow with Zane; Eileen McQuillan with Azzie; and Janet Young with Kayla and Tasha (again).

My volunteers helped me in all weather conditions, mostly without complaint. Thank-you to Ian Johnston; Letitia Morrison; Rowena Teal; Kiryn Weaver; Mark Hamer; Carol Nicholson; Nadine Fletcher; Kymberly Eagleson; Stacey Horton; Bridget Wrenn; Monique Jansen van Rensburg; Jeraldine Teng; Fiona Sanggang; Andrea O'Neill; Brad Siebert; and Claire Russell. Again, this project could not have been done without your help.

Thanks to everyone who collected reptile samples for me: Bruce Benseman, Rhys Mills and the other staff at Nga Manu Nature Reserve; Kelly Hare and Sue Keall at Victoria University of Wellington; Roger and Barbara Watkins; Heather Barton; Barbara Blanchard at Wellington Zoo; and Dominique Fortis at Otorohanga Kiwi House and Native Bird Park. This research was dependent on getting sufficient reptiles samples, and you were all very generous with the time and effort you put into collecting them for me. Thanks also to all the people at Massey University who carried cloths around for me.

I had useful discussions about my methods, analysis, tuatara, plants and dog obedience with Doug Armstrong; Sue Cooper; Lindsay Hazley; Ed Minot; Alasdair Noble; and Jill Rapson. Alasdair Robertson gave me tips on how to win favour with my thesis markers.

I would like to thank the other conservation dog handlers and associated people I have spoken to over the past few years: Graeme Atkins; Isabel Castro; John Cheyne; Dave Crouchley; Lance Dew; John McLennan; Jonathan Miles; Keri Neilson; Murray Potter; Steve Sawyer; Mandy Tocher; and Adele Smaill. Thank-you to Linda Kerley for giving me good advice on dog training; and Deborah Smith and Alice Whitelaw for sharing information on their own research with conservation dogs. Thanks also to Ian McLean for giving me tips on training a detection-dog.

Thank-you to Yvonne Gray from AgResearch for supplying weather information; Brian Carter at the Carter Observatory in Wellington for sunlight hours; and Barbara Just for sorting things out for me. Thanks to Dr Paddy Ryan for allowing me to use his fantastic photographs, and Louise June for braving the dogs and taking photographs for me. Rowena Teal tried to take some photographs too.

Thanks Ian for your support throughout the entire process, for standing in the rain watching dogs and reading hundreds of drafts of this thesis. Thanks to Fleur Maseyk and Dorothée Durpoix for reading drafts for me as well. Thanks to my parents for the food and encouragement. My friends in the Wildlife Ecology lab made me realise that my fieldwork could have been so much worse. Thanks to my dog for giving me my first grey hair.

Financial assistance was very gratefully received from the Julie Alley Bursary; the Institute of Veterinary, Animal and Biomedical Sciences and the Ecology Group, Institute of Natural Resources, Massey University. Thanks also to Lesley Dawson from Hills Pet Nutrition NZ Ltd. for providing a mountain of dog food. The Massey University Animal Ethics Committee gave approval for the experiments described in this thesis.
