WORK PATTERNS IN RESEARCH ORGANISATIONS:
A CASE STUDY
OF SOME SOCIAL ASPECTS OF SCIENTIFIC KNOWLEDGE DEVELOPMENT

A thesis presented in partial
fulfilment of the requirements for the degree
of Doctor of Philosophy at
Massey University

Richard Lubomir Hes
1980
ABSTRACT

This thesis involved an investigation of some social aspects of scientific knowledge development. In particular, it focused on the "work patterns" of problem solvers and the "effects" research organisations have on them. The proposed theories were tested in one government research organisation.

The "work patterns" of problem solvers were defined in terms of three stages of work (the Work Programme Development, the Idea Generation of specific projects, and the Problem Solving of these specific projects). It was hypothesised and substantiated, using the log-linear modelling technique, that each stage of work is associated with a distinctive pattern of communication, conceptualised in terms of six dimensions (sources of information, types of information, circumstances and modes of information transfer, and the effects of the information). It was shown that the Work Programme Development occurs in response to information, passively received, from external sources during formal circumstances. Ideas for specific projects are generated on the basis of scientific information acquired from journals. In solving specific projects, problem solvers actively consult internal sources, in informal circumstances.

The "effects" of organisations on the work patterns of problem solvers were considered by investigating the effects of (a) three organisational properties (analytic, structural, and global) on internal flows of communication, and (b) those environmental properties on external patterns of communication which could have been investigated in a case
study situation. Hypotheses were derived from the resource dependence theory of organisations which was proposed by Pfeffer and Salancik (1978).

The investigation of the effects of the research organisation on the internal flows of communication used locally optimal tests and showed that all three properties of organisations influence the formation of these communications. Internal communications occurred mainly within structural and global constraints, and among people who had similar attributes (analytic properties). Some evidence was found that close physical proximity, which had a strong influence on internal communication, could be overcome by colleague networks, which formed among people with similar analytic properties (autonomy, work related orientations and socially recognised work competence). Informal networks also played an important role in the formation of colleague networks.

The investigations of the effects of the research organisation on the patterns of external communication indicated that the vast majority of information which was received from external sources came from other research organisations, and the amount declined with increasing distance from the focal organisation. The very limited communication with the client communities was not geographically constrained.

Implications for research administrators were discussed. Consistent with attitudes of the respondents toward the roles of research administrators, the findings of this study suggest that the most important role of research administrators should be in facilitating communication, contacts, and the provision of resources.
ACKNOWLEDGEMENTS

My greatest debt is to two groups of people, physically a hundred miles apart, without whom this thesis would simply not exist:

To Professor Graeme Stuart Fraser, Dr Christopher Wilkes, and other staff members of Massey University for their guidance and forbearance with my many demands on their already heavily committed time. Professor Fraser's action and advice were especially helpful in overcoming the many crises associated with the preparation of the thesis. Dr Wilkes' and Professor Fraser's conscientious work on my drafts, which they carried out at all hours of the day and night, salvaged my hopes for the completion of the thesis in time available to do it.

To Peter Daymond-King, Marie Keir, and other staff members of Head Office of the DSIR, whose spiritual and material support eased greatly my tasks. Moreover, Peter Daymond-King's relentlessly minute examinations of all my drafts gave me continuous stimuli to proceed with the work.

Also, I wish to express my thanks to a number of people who were associated with the thesis at different times:

To Wilson Bailey, and Drs D. Boardman, C. Crothers, K. Hall, J. Johnston, and especially to Dr A. Levett for many hours of stimulating discussions during the time the project was born;
To the Director and staff of the Division of the DSIR who tolerated my presence in their work-place for a year, and whose cooperation enabled me to learn about work of problem solvers and to acquire the data reported in this study;

To the Director of the Applied Mathematics Division of the DSIR for his forbearance with my rather heavy use of computing resources;

To Messrs R. Brownrigg, B. Campbell and Dr S. White of the AMD for their patience with me, when attempting to learn about computers and computing; and to G. Dickinson, Dr R. Davies, J. Thompson, and other statisticians of AMD for their ideas concerning statistical analyses. I am also grateful to C. Nicolson and other AMD staff members who allowed me to use their equipment near the end of this project when, consistent with the Murphy's laws, things went wrong, and who kept switching the computers on during nights and weekends.

The main report was "typed" by the BURROUGHS 6700 computer of the Victoria University of Wellington. The computer was "directed" in this task by the word processing program RUNOFF which the university obtained from the CUBE library. The file of text which the RUNOFF then formatted was prepared and edited on the B6700 computer via CANDE, as well as the HP2100 computer maintained by the AMD Division of the DSIR, via ED.CAN, a BASIC text editing program which simulates the B6700 CANDE editor. The ED.CAN editor was written and several times modified by the staff of AMD. The use of this HP2100 facility did save some computer funds.

As my handwriting is regarded as illegible, the use of the computers enabled me to submit endless drafts, and at the same time, to keep
friendly relations with the typists of the Head Office of the DSIR. I am
nevertheless grateful to these people. They typed the first draft and
the bibliography.

Finally, I wish to thank my family to whom I intend to return.

My debt to so many people and machines does not, of course, discharge my
responsibility for the presentation of the thesis, and the findings and
conclusions reported, which I explicitly acknowledge.

CHAPTER 1  INTRODUCTION

- PROBLEM AREA OF THE STUDY
  - Theoretical issues
  - Problems investigated in this study
  - Practical issues in science policy

- A BRIEF OVERVIEW OF THE MAIN ARGUMENTS ADVANCED IN THE STUDY
  - A theory of work patterns
  - A theory of research organisations, their organisational environments, and their effects on work patterns

LIMITATIONS OF THE STUDY

SUMMARY AND OUTLINE OF THE THESIS

NOTES

CHAPTER 2  DESCRIPTION OF THE RESEARCH ORGANISATION STUDIED AND ITS ENVIRONMENT

- COMPARATIVE FEATURES OF THE ORGANISATION
  - A brief history
  - Size
  - Rate of growth
  - Ratio between scientists and science technicians
  - Age structure
  - Staff qualifications

- OTHER SOCIO-POLITICAL CHARACTERISTICS
  - Work related past experience
  - Centrality of the respondents in the four systems
  - Attitudes toward the four systems
  - Attitudes toward teamwork

- OVERVIEW OF PROJECTS
  - Distribution of project stages
  - Project characteristics in terms of facilities used
  - Characteristics of projects in terms of communications
  - The process of projects

SUMMARY AND CONCLUSION
